"But," I rejoined, "what makes it have this fine yellow shade?"

"That is the result of the beef suet used in its manufacture,—that and the olive oil which also has the effect of giving it a yellow shade," he explained. (Since we have now no law prohibiting its being colored this point is of no importance.)

"Oh!" said I, reflectively.

"I tell you what," continued the man, "this oleomargarine is a blessing to the laboring man. It's better than two-thirds of the butter made in this county, and sells at five to eight cents less per pound." And thereupon he entered into a lengthy and detailed account of the merits of this stuff which is doing so much to render the sale of butter unremunerative. But evidently it all depends upon "whose brush is burning" how we look at this question as well as others, for to one whose interests are in the dairy line it seems to be more of a curse than a blessing.

One of our institute workers, Mr. L. W. Oviatt, of Bay County, a successful farmer and sheep breeder, tells of a rather novel way of investing in stock. He is the owner of quite a large number of cows, but rents them out in this wise He buys young cows, preferably in the fall when they are cheap, and lets them to any one who will keep them three years; he to have the first calf at the end of that time. This gives him a two-year old for the use of the cow, which is then let again to the same or to other parties. Another plan is to let with the cow a calf or yearling to be kept for one year, which pays for the use of the cow that length of time.

The increased value of the young animal is usually ten to fifteen dollars which is a pretty good rate of interest on the value of the cow. Mr. Oviatt says that while he considers these investments eminently satisfactory to himself, the other parties in the contract are equally well pleased. Oftimes these are poor men who have not the means of purchasing a cow, consequently have none. Yet they have a few acres of land or rent a small farm unstocked, and so have plenty of pasture and roughage for young stock. This is not missed in the keeping of the calf or yearling and they are thus enabled to have the use of a cow for the family. In case the cow dies they are not asked to replace it, but it is expected that this rarely happens.

I think those who have made the acquaintance of that genial gentleman and up to date

Few Days' Brew of Deadly Uric Acid.

In a few days you brew enough uric acid in your own body to produce death.

Your kidneys are your only salvation.

Because when they are well, they filter out this deadly poison.

So, when your kidneys are sick, you can understand how quickly your entire body is affected, and how every organ seems to fail to do its duty.

They are all being slowly poisoned.

Uric acid poison irritates the nerves, and causes rheumatic pains in joints, muscles, limbs, headache, backache, stomach and liver trouble, shortness of breath, heart trouble, dizziness, nervousness, irritability, lassitude, loss of ambition, weakness and wasting away.

Red brick dust and similar sediments in the urine are also caused by various salts of uric acid.

The cure for these troubles is Dr. Kilmer's Swamp-Root, the great kidney remedy.

It instantly relieves the congested, overworked kidneys, and gradually brings them back to health.

Healthy kidneys keep down the excess of uric acid, and you soon feel the benefit in new health and strength.

Swamp-Root should at once be taken upon the least sign of ill health. It will make you well and is for sale the world over in bottles of two sizes and two prices, fifty-cent and one-dollar.

Swamp-Root is used in the leading hospitals; recommended by skillful physicians in their private practice; and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy for kidney and bladder troubles.

To prove its wonderful efficacy, send your name and address to Dr. Kilmer & Co., Binghamton, N. Y., mentioning this paper, when you will receive, free of all charge, a sample bottle of Swamp-Root and a valuable book, by mail, *prepaid*. This book contains many of the thousands upon thousands of testimonial letters received from men and women cured.

dairy authority, Prof. C. D. Smith of Michigan Agricultural College, will readily recognize the originality of the following:

At the recent meeting of the Michigan Improved Live Stock Association he expressed himself strongly against mixing the different breeds of cattle. Said he: "I like buckwheat cakes, and I think highly of fertilizers but I don't want them mixed on my breakfast table."

By crossing the breeds, Prof. Smith urges that one arrived at unsatisfactory results, and that the different types should be bred for what they are intended. He believes that Herefords, Holsteins, Jerseys and Shorthorns each have a legitimate place and each breed is all right in its place.

Considerable discussion at this meeting was given to the subject just now looming into prominence, in Michigan, regarding the food value of sugar beet pulp. Opinions differ as to its actual value. Prof. Smith advises going slow, and learning from experience, what it is worth to the individual feeder. He places its fattening power at half that of corn silage. In California and Nebraska, beet pulp—the refuse from beet factories—has been successfully used by feeders. While it possesses no particular fattening properties, it acts as an appetizer, and tends to keep the system relaxed, when animals are on dry food. In France this pulp is largely employed in feeding stock of all kinds, giving excellent satisfaction.

Farmers living near the factories here, are experimenting with this as a stock food, and, as is usually the case, with any subject, some are in favor of it, while others disapprove of it entirely. Fed to milch cows, it assimilates nicely with other food, but is entirely lacking in most of the elements found in the entire beet.

It may be well to state here, that sugar beets are superior to all other roots as a stock food, excelling even carrots, which are generally considered as occupying a position at the head of the list.

In conversation with a farmer, who is, also, something of a dairyman, not long since, he was telling me something about his cows. They are of no particular breed, being, as he expressed it, "all mixed up."

Like every other farmer though, he has one cow which beats all the rest. She gives the most milk, and it is so rich—"why" said he, "you never saw how thick the cream rises on it." When asked to describe her, he confessed at the outset, that she was "homely as a hedge fence," with protruding bones in spite of all that was fed her. Proceeding with the description, it transpired that she carries the true dairy form, even to the "hump" over the hips. Of course I nodded my head wisely, as he progressed with the description, as much as to say, I told you so.

As fast as farmers realize the value of the silo, they are being built and used. Every where we hear good words spoken in regard to ensilage as a cheap and convenient stock food. Some prefer to pick off the large ears before cutting, others leave all on, but either way is eminently satisfactory. The silo has come to stay. W. C. ROCKWOOD.

Genesee, Co., Mich.

CONCERNING OUR ADVERTISERS.

As an evidence of the universal interest taken in artificial incubation, and the confidence which the whole world places in American-made incubators, we refer to an order recently received by the Des Moines Incubator Co., of Des Moines, Iowa, through their New York agents, for a shipment of fourteen machines to go to parties in Sydney, Australia.

Every man of experience knows that barring accident the wheels of a wagon, buggy, or other vehicle are always the first parts to wear out. This is true for the best of reasons and not necessarily because the wheels are of inferior quality. It is simply because the most trying work is always demanded from those parts. It transpires therefore that the wheels come in for the greatest amount of repair, which is always an expensive element. Resetting of tires, new rims, refilling of the wheels, etc., while they have a tendency to temporarily prolong the life of the same, may easily become more expensive than the purchase of an entire new set of wheels. Since wheels will give out, even under the best of care and conditions, long before the remainder of the vehicle shows any serious wear, it means in most cases that the simple purchase of a new set of wheels makes practically a new vehicle. These things have been brought to mind by the advertisment of the Wilmington Wheel Co., which appears on another page of this issue. These people manufacture wheels for various kind of vehicles and sell them direct to the consumer at what seems to us very reasonable prices. We know this to be an old and reliable concern and that they can be depended upon to do just what they agree to do. If you should need wheels now, or will be needing them this spring to repair or overhaul a vehicle of any kind, it will certainly pay you to correspond with the Wilmington Wheel Co., Wilmington, Del.

Concerning Solifine, a preparation which is being manufactured by the Milwaukee Chemical Works of Milwaukee, Wis. and being regularly advertised in these columns, we wish to say a word. Solfiline is an oily preparation designed especially for treating leather. It possesses the property of excluding absolutely all moisture and dampness when applied to boots and shoes; it makes harshness soft, pliable and water and wear resisting. For treating all kinds of leather belting it tends to knit the fibers of the leather more closely together, greatly increasing the tensile strength and avoiding all undue stretching or breaking.

We have been informed by trustworthy parties, who have tested it, that Solfiline is entirely reliable, and will meet every claim made for it. We publish herewith a letter from one of the creameries where it has been in use.

DARIEN, Wis., 11-14, 1899.

Milwaukee Chemical Works, Milwaukee, Wis., GENTLEMEN:—Yours at hand making inquiry as regards the sample can of Solfiline you sent us. Replying I would say that I have tried it thoroughly, and it is fine. The best I have ever used for belts and leather boots. Yours truly,

A. E. WEAVER.

The price and terms are entirely reasonable and fair. These people are offering to deliver a gallon can of Solfiline, express prepaid, to any address in the United States. Write them for circulars, testimonials, etc.

The American Harrow Co., of Detroit, Mich., are placing on the market a manure spreader, of which they are very anxious to place descriptive matter in the hands of the readers of HOARD'S DAIRYMAN. Dairy farmers who have a large number of cows will find this spreader quite a labor saver as well as doing the work much better and quicker than by hand. It is a self feeder and can be placed on any ordinary wagon. Many readers of the DAIRYMAN are interested and ought to send for their booklet "E" which fully describes the spreader.

DAIRY MARKETS.

ELGIN, Ill., Dec. 22—Butter—On the Board of Trade today, 2,340 lbs. of butter were offered, but no bids were received. The Quotation committee declared the market firm at 26c. Five hundred and seventy thousand lbs. were sold during the week.

CHICAGO, ILL., Dec. 26.—Butter—Extra creamery, 25½c; firsts, 21@22c; seconds, 17@18c; imitation creameries, 18@20c; dairies, choice to fancy, 22c; firsts, 19c; ladles, fine, 17@17½c; packing stock, fresh, 16½c; roll, 16¼@17c.

Cheese—Full cream, twins, good to choice, 11@12c; off grades, 8@10c; young America, 12½c; cheddars, 11¾@12c: Swiss, 12½@13c; Limburger, 10@12c; bricks, 10@12c.

Eggs—Strictly fresh laid, cases returned, 17c; city cooler stock, 11½@12c; country, 9@ 0c.

Cattle—Good to choice fat cattle have advanced about 25c during the week, closing steady to strong for all classes. Good to choice 5.60@5.75; poor to medium 4.35@5.45; mixed stockers 3.10@3 80; selected feeders 4.25@4.90; good to choice cows 3.50@4.50; heifers 3.20@5.00; canners 2.25@3.05; bulls 2.65@4.40; calves 4.00@7.00; fed Texas beeves 4.40@5.25.

SHEBOYGAN FALLS, Wis., Dec. 20—Twelve factories offered 758 boxes of cheese on the call board to-day, and all except 83 were sold as follows: 280 cases Young Americas at 12 cents; 123 at 11⅞ cents; 75 at 11¾ cents; 35 Longhorns at 12⅜ cents; 70 Daisies at 11½ cents; 31 Twins at 11 cents, and 61 at 10⅞ cents. Adjourned to Wednesday, Jan. 3.

MANITOWOC, Wis., Dec. 20—The dairy board closed its weekly meetings to-day for this season. Offers to-day were: 100 boxes Daisies, 200 boxes Young Americas. All sold at 11 cents.

NEW YORK, Dec. 23 —Butter—Extra western creamery 27c firm. Ladles 17@18c, extra June 25@25½c. Trade quiet. Receipts 2800.

Eggs—Fresh eggs 23@24c; refrigerators 12@15c. Receipts 5500.

BOSTON, Mass., Dec. 23.—Butter—Market steady 27c.

Cheese—12½@13c.

Eggs—Market remains about the same. Fresh eggs in good demand.

WASHINGTON, D. C., Dec. 23.—Butter—Market firm. Extras 27½c; choice firsts 25c; fine imitations 21c.

PHILADELPHIA, Pa., Dec 23. Butter—Market firm, extra creamery 27½c prints 29c.

KANSAS CITY, Dec. 23.—Butter—Extra creameries one cent lower. Trade dull.

NEWARK, N. J Dec. 23.—Butter—Market firm, 27c for strictly extra Elgins. Receipts fair.

NEW ORLEANS, La., Dec. 23.—Butter—Market steady, fairly active 27@2,½c.

Eggs—Storage eggs 14c.

Cheese—Unchanged.

BALTIMORE MARKET.

BALTIMORE, Dec., 21—Butter—The conditions that have been prevalent in the market for some time past still obtain, and in a large degree we can only repeat what has formerly been reported. The receipts are quite moderate of all kinds and grades, below the wants, indeed, of choice fresh creamery and fine imitation. Some of the usually fancy marks of creamery are showing slight wintry defects, but these in the prevailing scarcity are not so disastrous as would be the case if there were more lots to choose from. Former figures are well maintained, and we even mark them up slightly on some grades There is still a good demand for choice fresh gathered cream creamery, and very little indeed coming to hand. Fancy imitation and fine ladles have not put in appearance, although some good ladles have been offered this week and have been sold at our revised quotations. The lots of cold storage butter remaining unsold are few, and quality poor, as far as has been reported. Receipts of roll butter continue very limited in quantity, and are sold promptly to eager customers. Store-packed stock is also in light receipt and active demand. Baking butter all sold up close to arrivals.

Creamery Separator, extras, 27@28; firsts, 25@26; seconds, 23@24. Creamery Gathered Cream, extras, 24@25; firsts, 23; seconds, 21@22. Creamery Ohio, extras, 25; firsts, 22@23; seconds, 20. Creamery Imitation, firsts, 19@20; seconds, 17@18 Iowa & N. W. Ladle, firsts, 19; seconds, 16. Ohio & Indiana Ladle, firsts, 18@19: seconds, 16. Ohio Rolls, extras, 19@20; firsts, 18: seconds, 16@17. W. Va. Rolls, extras, 18; firsts, 17; seconds. 16. Ohio & W. Va. Storepacked, extras, 17; firsts, 16: seconds, 15. Creamery Blocks (2 lbs.), extras, 28; firsts, 27; seconds, 25@26. Creamery Prints (½ lb) exeras, 29; firsts, 28: seconds, 25@26. Md , Va., & Penna. Prints, extras, 24@25; firsts, 22@23; seconds, 20@21.

Cheese—Receipts light, demand very good; market steady.

N. Y. State Cheddars, fine, 12¾@13; choice, 12¼@12½; fair. 11½@11¾. Flats, fine, 13; choice, 12½@12¾; fair, 12¼@12½. Small, fine, 13¼@13½; choice, 13; fair, 12½. Ohio Flats, fine, 12@12¾; choice, 12¼@12½; fair, 11½@12. Ohio Picnic, fine, 13@13¼; choice, 12½@12¾; fair, 11½@12¼. Swiss cheese, fine, 12@12½; choice, 11½@11¾; fair, 10½@11.

Eggs—The receipts of choice fresh eggs have been more liberal the past few days; the demand for this kind continues good; market steady as quoted. Cold Storage—There are all kinds being offered, consequently there is an easier feeling in the market. All good to choice marks meet with prompt sale at 20 cents.

G. M. LAMB & BROS.

301 Exchange Place.

Situation as manager or superintendent of stock or dairy farm. Understand breeding of stock. An up-to-date and practical farmer of years' experience. Recommendations, etc. Address No. 9, care Hoard's Dairyman 45-3

"ALPHA=DE LAVAL"

Cream Separators

"ALPHA"—DE LAVAL MACHINES possess every merit to be found in any other separator made—they do everything any other separator can do,

IN ADDITION:—

They skim one-tenth to three-tenths closer in test percentages than any other separator can under practical conditions of operation.

Their actual capacity is twenty-five per cent. greater than the claimed capacities of other machines of relative size and price.

They use just so much less relative power by reason of their smaller size bowls and necessary speed of only 6,000 rev. per minute against larger bowls and speed of 8,000 to 25,000 rev. in other machines.

From the same reasons their cost of repairs is just so much less and their durability so much greater.

And again from much the same reasons their cream is the more uniform, more thoroughly and quickly churnable, and productive of superior excellence in butter.

They are alone of the improved "Alpha" disc type of construction, which protecting patents prevent the use of in any other machine, and which gives them their overwhelming advantages in many respects.

Their mechanical design and construction is the best. Their selling prices are absolutely maintained. Consideration of cost need not and does not enter into their manufacture.

"Factory" or "Dairy" catalogues upon application.

Apply to agents Chicago & North-Western R'y for full particulars. 45-2

A B C IN BUTTERMAKING.

In our answers to correspondents, we have frequently advised them to procure Mr. Monrad's latest book.

Under the above title the author has written what is truly a book on the first principles of buttermaking and we heartily recommend it to any dairyman who is taking the first or last steps in the art and science of making good butter. Theory as well as practice is treated of, and the places where the novice is most liable to stumble are pointed out and methods indicated for bridging or avoiding them all together.

The book can be obtained of this office for $.050 post paid.

Annual Meeting of the American Guernsey Cattle Club.

ED. HOARD'S DAIRYMAN:—The annual meeting of the American Guernsey Cattle Club was held at the Fifth Avenue Hotel in New York City on Dec. 13th. It was one of the most interesting and well attended of any meetings ever held. Several very important matters were discussed and acted upon.

The Secretary in submitting his report of the year contrasted same with that of the last few years and it was shown that the business of the club had nearly doubled in in five years. About forty-five per cent of the entire number of entries and transfers had been put on the books during that time.

The committee appointed one year ago to have charge of the re-arrangement and equipment of the office of the club gave a review of the work accomplished. After careful investigation it was decided to continue the card system of records. Accordingly a new form of cards has been gotten that will give a complete history of each animal on a single card. The interiors of the safes have been fitted with filing devices of the latest and most approved pattern and the cards arranged alphabetically in same. With the new arrangement the work of examining the papers as presented for entry will be greatly facilitated. A fire proof office building was thought to to be a question that sometime in the future the club would be called upon to meet.

A building fund was suggested by the Secretary in his report and the club instructed the Excutive Committee to adopt the suggestion and invest during the year $1,000 for said purpose.

The constitution of the club was amended so that the annual meetings will hereafter be held in the month of May instead of December.

The committee to whom was assigned the task of preparing a new scale of points reported one. This brought out a great deal of very interesting discussion which was very valuable to all present. The scale submitted seemed to meet with general approval and was referred back to the committee for a few slight changes in the distribution of the number of points assigned to the different heads, and will then be published by the committee as the standard adopted. This scale will be the first one to bring the makeup of the dairy cow prominent with her utility, rather than fancy breed characteristics the leading feature.

Great interest centered in the results of the Home Butter Tests which the club has conducted during the year. At the last annual meeting of the club $300 was appropriated for prizes for the best year's record made by single cows and by herds of five. The conditions of the competition included the reporting of the weights of the milk to the secretary each month, and the sending of a composite sample once a month to the Experiment Station in the state in which the cow was owned. These samples were submitted to the determination of butter fat by the Babcock method and the results reported to the Secretary by the stations.

Several times during the year some one from the stations, or a good responsible party, was sent to the farms where the cows were located and weighed the milk and sampled same, so to check the owners in their work. In no instance has any suspicion of unfair work been seen, and in case of the single cows making the largest records special pains has been taken to have the work freely and frequently inspected by the party from the Wisconsin Experiment Station who conducted the analytical work.

The result of the year's work bears a great significance to the dairy cow as well as to the Guernsey in particular. They show the best records that have ever been made, where backed by any experiment station or public supervision. A careful estimate of the feed and a description of the manner of handling the cows was kept. These will soon be issued from the office of the club in the detailed report of the work, and will also be sent to the agricultural press within a week or two, or just as soon as it can be drawn from the records. The following figures show the summary of the work:

The officers for the ensuing year were elected as follows:

President, James M. Codman, Brookline, Mass; Vice Presidents, A. J. Cassatt, Philadelphia, Pa.; Sidney Fisher, Minister of Agriculture, Canada. Member Executive committee for four years, Francis Shaw, Boston, Mass; Secretary and Treasurer, Wm. H. Caldwell, Peterboro, N. H.; Committee on new members, Francis Shaw, Boston, Mass., N. K. Fairbank, Chicago, Ill., E. T. Gill, Haddonfield, N. J.

Building an Ice House.

ED. HOARD'S DAIRYMAN:—In 1895 we built an ice house adjoining the north end of our dairy, which measures twenty feet on that side. Using thirteen-foot rough hemlock boards, we laid out the building thirteen feet north. Three chestnut posts, sided on two sides to six inches, were set up in the ground on the east and west sides. Five similar posts were set across the north twenty foot side.

All the north posts were cut off to correspond with gable elevation of the dairy. Two six inch hemlock boards nailed on top of the side posts made a plate 2×6. A ridge pole and two gallows plates made from chestnut poles ran from the three north center poles to motises in the north dairy rafter, and the frame was done. This was boarded up outside and inside with rough hemlock boards and the space filled in with sawdust. Plenty of air and daylight and some sunshine come in at the top. The roof was made of the same boards, by laying two 8-inch boards flat, four inches apart, and one over the space for a batting. A door for filling was put in the east side, and a door made into the dairy for filling the ice chest.

We set the north gallows posts so 13-foot boards would splice on them, alternating from side to side. As a 19½ foot garment would not cover a 20-foot body, we cased the north sides of the corner posts to fill out. This house goes into the ground about a foot, with drainage. In the winter of '98-99 we put in thirty-eight 2-horse loads. It would hold forty-five or fifty. The posts are nine or ten feet.

During the hot months of 1899, we were making from 400 to 500 pounds of butter per month, and handling 100 to 125 quarts retail milk per day, besides all the ice used in the house and given to neighbors, and had three layers of ice in the bottom of the house, when the season ended. So the thirty-eight loads kept reasonably well.

Anyone can figure the cost for themselves. It isn't much. Anyone can spend as much more as they like for luxury in an ice house, but another dollar isn't necessary to keep the ice. Keep the bottom tight and the top open, plenty of saw dust or shavings on top to tread down around the edges where holes melt in May and June. About six inches of saw dust was put on the leveled earth bottom under the ice and four inches around the edge of the ice inside the lining. Saw dust was swept over each layer of ice to fill up cracks as the packing progressed. However, if the outside is kept snug, one needn't worry much about the crevices between the cakes.

Southport, Conn. E. C. BIRGE.

A Progressive New York Dairyman.

ED. HOARD'S DAIRYMAN:—I have been a reader of your paper for about one year and am very much pleased with it as I get more knowledge from it than from any other source that I have ever found.

Am very much interested in the feeding columns. We make butter, sell to yearly customers at twenty-five cents per pound; make 250 to 260 pounds yearly from each cow (usually about half heifers). Have used pure Jersey bull with native cows to start with, and now cows are all high grade Jerseys, weighing probably from 650 to 900 pounds; skim milk goes to pigs and calves and chickens.

I try to feed a balanced ration or nearly so. Am feeding now twenty pounds silage, ten pounds mixed hay, (clover and timothy), a little straw, four pounds corn and oats

HEART DISEASE

Some Facts Regarding the Rapid Increase of Heart Trouble.

Heart trouble, at least among the Americans, is certainly increasing and while this may be largely due to the excitement and worry of American business life, it is more often the result of weak stomachs, of poor digestion.

Real organic disease is incurable, but not one case in a hundred of heart trouble is organic.

The close relation between heart trouble and poor digestion is because both organs are controlled by the same great nerves, the Sympathic and Pneumogastric.

In another way also the heart is affected by the ferm of poor digestion which causes gas and fermentation from half digested food. There is a feeling of oppression and heaviness in the chest caused by pressure of the distended stomach on the heart and lungs, interfering with their action; hence arises palpitation and short breath.

Poor digestion also poisons the blood, making it thin and watery, which irritates and weakens the heart.

The most sensible treatment for heart trouble is to improve the digestion and to insure the prompt assimilation of food.

This can be done by the regular use after meals of some safe, pleasant and effective digestive preparation, like Stewart's Dyspepsia Tablets, which may be found at most drug stores, and which contain valuable, harmless, digestive elements in a pleasant, convenient form.

It is safe to say that the regular persistent use of Stuart's Dyspepsia Tablets at meal time will cure any form of stomach trouble except cancer of the stomach.

Full sized package of these tablets sold by druggists at 50 cents. Little book on stomach troubles mailed free. Address F. A. Stuart Co., Marshall, Mich.

Your Success

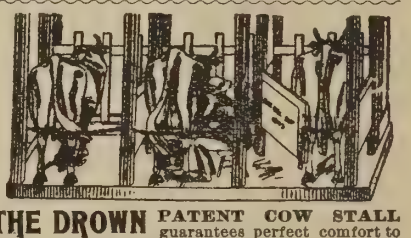
depends largely upon the success of the firm you work for.

You will find that success is not very elusive if you take the agency for

The Ladies' Home Journal
AND
The Saturday Evening Post

because these are two of the most successful periodicals in America.

We want reliable, competent, ambitious agents in every town.



The commissions on all subscriptions, and the rebates for large clubs, are liberal enough to make every good agent happy.

And $18,000 in *addition* to all commissions and rebates, which is to be divided among 764 of the best agents at the end of the season, will add a good deal to that happiness.

Write for particulars.

mixed and six pounds buckwheat middlings, with some of the hulls with it. The buckwheat feed is $10.00 per ton; corn meal, $15.40; oats I have. Cows commenced to freshen August first; have about two or three freshen every month but April, May, June and July; usually feed some oil meal, but have not fed any yet this winter, as it is $1.50 per cwt. Gluten feeds are not sold here. Please set me right. We do not feed all our cows the same quantity.

Ellicottville. N. Y. C. E. C.

The yield of butter reported above is very far above the average and in a way satisfactory. However, we incline to the opinion that these cows are not doing as well as they might, and that our friend should not be satisfied until he is receiving at least 300 pounds of butter for each cow in his herd, including heifers. To accomplish this it may be necessary to dispose of some of the animals now in the herd and possibly some of those which command the most admiration. But in the dairying as nowhere else "handsome is as handsome does." A cow that will not yield 260 pounds or more of butter per year should not be retained. This will raise the average very decidedly. To ascertain which of these cows, if any, fall below this standard it is indispensible to keep a daily record of each cow's production and to test samples of her milk often enough to give a fair average as to quality.

From the feeds named we can do no better than suggest the following as the average daily allowance for each cow:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
10 lbs. clover hay	8.53	.48	3.96	.16
4 lbs. corn and oats	3.56	.34	2.08	.17
8 lbs. buckwheat middlings	5.24	1.32	2.00	.33
Totals	22.61	2.40	10.84	.80

Of course these buckwheat middlings "with some of the hulls included" are of rather uncertain value. The chances are that there will be somwhat less protein and fat in the ration above given, than the figures would seem to indicate.

A Feeding Problem From an Ohio Milkman.

ED. HOARD'S DAIRYMAN:—We have a dairy of 50 cows and sell milk in town for 6 cents per quart in winter, 5 cents in summer, and in bulk, 16 cents per gallon. We have plenty of mixed clover and timothy hay, corn and cob meal and oats, and have contracted our bran for $14.50 per ton; can buy oil meal for $30 per ton, but think that is too high in price. Will you please give us a balanced ration of the above feeds, and then suggest anything that might be more profitable. We had about 30 acres of corn fodder, but have fed a great portion of it; will be all gone by middle winter. We feed it whole, once a day, with all the hay they will take twice a day. My cows are mostly Jerseys. We would like to feed them for the best profit and make the most of what feed we have. We are readers of HOARD'S DAIRYMAN and think it a valuable paper. A. V. J.

Elyria, Ohio.

With such a market and such cows as are described above we are very confident the more liberal the feed the greater will be the profit; and by liberal we have regard to the kind and quality of the feed as well as its quantity. Therefore we offer the following suggestion:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. mixed hay	13.80	.72	5.94	.24
4 lbs. corn and cob meal	3.56	.26	2.52	.14
8 lbs. bran	7.05	1.00	3.09	.24
1 lb. oil meal	.91	.29	.33	.07
Totals	25.32	2.27	11.88	.69

We have specified corn and cob meal in the above formula because that is the form in which our inquirer puts it, but when bran is fed in connection with corn we ordinarily prefer the ground corn (corn chop) without the cob. In the event that he can as conveniently provide corn chop, we would substitute 3 lbs. of it for the 4 lbs. of corn and cob meal. An additional pound of oil meal might also be found profitable with some cows.

Prizes at the Ohio State Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The question has recently been asked whether the prizes offered on butter and cheese at the next meeting of the Ohio State Dairymen's Association, at the Ohio State University, Columbus, February 13th and 14th, are open to a certain set of dairymen, or whether it is open to all dairymen, and dairywomen as well.

The Association desires to announce that these prizes are open to all persons within the state of Ohio, without reference to race, color or sex. Neither is it necessary to become a member of the Association in order to compete for these prizes. The cash premiums offered amount to $159, and other premiums are worth about $75 more. The Association has thrown the doors wide open to all persons of the state, whether they help to support the Association or not. It is hoped, however, that all persons interested in dairying, whether exhibitors or not will support the objects of the Association by joining it, which they may do upon the payment of $1.00.

It is also hoped that all persons who send exhibits will attend the Association, but this is not necessary as the exhibits may be sent by express, prepaid to the undersigned, care of Townshend Hall, Ohio State University, Columbus, where they will be received and placed upon exhibition. Every package of butter will be scored, and the score cards will be given showing score of exhibit, and also highest, lowest and average score of exhibits in that class. Persons whose exhibit scores above 90 points will be awarded a diploma.

After the meeting, unless otherwise ordered, the exhibits will be sold by the Secretary, and money promptly remitted to the exhibitor. For further information, send to Secretary L. P. Bailey, Tacoma, Ohio, for a copy of the program and premium list.

THOMAS F. HUNT,
Chairman Committee on Exhibits.

But One Standard of Quality.

There are three distinct types of Singer sewing-machines for family use, but there is only one standard of quality—THE BEST. There is a wide range of prices, depending on the style of cabinet work and ornamentation, but whether the price be the lowest or the highest, the working quality of the machine is the same and has been fully tested before leaving the factory.

Sold on Instalments. You can try one Free. Old machines taken in exchange.

SINGER SEWING-MACHINES ARE MADE AND SOLD ONLY BY

Cash Supply & Mfg. Co., Dept. C, Kalamazoo, Mich.

Here's Another Instance

Where the other machine came out second best in a contest with the **Reid** Long Spindle Separator. In a letter from the Delta (Pa.) Creamery Co., under date of November 27th, 1899, Mr. Hitchcock, the manager, says:

"During a contest at our Delta Creamery between the Alpha and Reid Separators, ***I found the Reid to be decidedly the closest skimmer and very much the better machine to operate."***
(Signed) HENRY HITCHCOCK, Mgr.

And here's another case where the Reid proved itself to be the closest **skimmer.**

"Our Improved Reid Separator runs fine and does good work; no trouble at all. The State Inspector called the other day and I ran him a test of two samples; one was .015 and the other .02. ***He said my Reid beat the Alpha,*** *for he came from another creamery which used Alphas and their test showed .03 and .05. The Reid is O. K."*
Fairmont, Minn. *AMBER LAKE CREAMERY CO.*
(Signed) R. L. BRADBURN, Butter Maker.

These are but samples of many letters that we have received in praise of the

REID LONG SPINDLE SEPARATOR

Every one of which is a voluntary testimonial on the part of the writer to the merit of the most efficient skimming machine ever built. Read the concluding paragraph of the following letter from the Fayette (Wis.) Creamery Co.:

"Our new Reid Long Spindle Separator is skimming at the rate of 2,536 lbs. per hour. Yesterday two tests were made; one in the early part of the run and the other after the machine had skimmed about 6,000 lbs. The tests were made by our butter-maker in the usual way, and neither test showed more than a mere trace of fat. We are pleased with the machine in every way. It requires so little oil that it is hardly worth taking into account. One filling of the oil-cup will last for a run of 10,000 lbs.
This testimonial is not paid for—was not asked for—but is given as a voluntary tribute to a machine of merit" *(Signed) L. B. LOWRIE, Sec'y.*

Separator book, facts about pasteurization and the Reid Pasteurizer and catalogue of Creamery Supplies—all free if you write for them.

A. H. REID, 30th and Market Sts., PHILADELPHIA, PA., and CEDAR RAPIDS, IOWA.

Pure Food Legislation.

[Extract from an Address by Hon. H. C. Adams, before the Maine Dairymen's Association.]

The force which has been behind most of the pure food legislation of the United States for the last fifteen years has been the farmer. Since he engaged in the battle for honest food products, most of our pure food legislation has been enacted. The dairy commissions of the several states have been brought into life, because the farmers demand not only laws, but the machinery to enforce them. When the American farmer is roused, he keeps everybody busy. He may be childish sometimes, but nobody accuses him of being weak when he stirs his class to action in a movement that is right. The American farmer can get along without flattery. He ought not to get along without justice. He sometimes nods and sleeps over public questions, but when he goes at it in earnest, to take a hand in their settlement, political rings are broken, unwise political bosses go up in the air, golden collars become a rope of sand, and popular judgment is crystalized into law. Farmers in different sections of the country may have temporary aberration of mind, and take up fads exploited by agricultural demagogues that are prejudicial to the public good. They may sometimes be led into unreasoning denunciation of wealth, of political parties, of courts, and of other classes, but the great bulk of farm judgment to-day is stronger and better than it ever was, because it is more intelligent. It can be relied upon if it can be secured. The farmers beseiged Congress, and fairly compelled that body to pass the oleomargarine law of 1886. It was charged then, as it is now, that that act was class legislation. It was an act to prevent the destruction of the great butter industry of this country by a business which depends for its success upon deceiving the public. If that act had been class legislation, would not the olemargarine interest, which was aggrieved by it, have used the money, of which it had an ample supply, to secure legal talent, which would have compelled a favorable decision from the courts, if it had a good case?

Oleomargarine laws have been upheld by the courts, not because they helped farmers, but because they prohibit the delivery to a man who buys and pays for butter, of something which is not butter. The dairy industry of the United States is of sufficient importance to be gracefully accorded any benefits which may come from the prohibition or limitation of a fraud in trade.

The butter product of this country has an estimated annual value of $300,000,000. All of the silver and gold products of the country for two years, could be bought with the product of the churn for a single year. Not only that, but the cow leaves behind her farms which are richer in fertility, and farmers richer in the knowledge which the mysteries of her life and product compel. The dairy business of this country has renovated thousands of farms, and hundreds of thousands of farmers. It has revolutionized the agriculture of my own state, as it has Iowa, and as it will Minnesota, Illinois and Michigan. It is the enemy of farm mortgages, the friend of the merchant, the manufacturer and men of all classes, except those who imitate the product, and claim a God-given right to copy the form of that product and steal its color. Only the limitations of state and federal constitutions should restrict the laws that hamper the traffic in counterfeit butter.

Oleomargarine has its rights. It has a right to be composed of lard, beef fat and cotton seed oil. It has a right to be sold under its own name and color, if not injurious to the public health. It has a right to be manufactured at a cost of eight cents per pound and retailed for twenty cents per pound, but it has not the right to crawl into market, in the clothing of a more costly product. The law of 1886 taxed oleomargarine two cents per pound. It should have been taxed ten cents per pound. The small tax was accepted because the act provided for the branding of packages, and thus guaranteed to first purchasers a knowledge of what they bought. No matter what is claimed by the friends or enemies of the olomargarine interest, this tax has greatly restricted the oleomargarine output. Eighty-seven million pounds were manufactured last year. Untrammeled by federal law, the product would have been five times that amount. But the law has been ineffective in this; the patron of the restaurants, boarding houses and hotels, where oleomargarine is used, cannot be informed as to what he is getting by labels upon original packages. He calls for butter, and gets a cheap counterfeit. While stamped by the government, the actual consumer is deceived. The simple fact is, that the great bulk of the oleomargarine product is eaten as and for butter.

It is said that good oleomargarine is better than poor butter. This is not disputed. But poor butter does not fool anybody. It may be poor and not very respectable, but it is honest. It advertises its own deplorable condition. It may look well, but even to the delicate senses of an oleomargarine advocate, its divorcement from the breath of new mown hay, and the scent of clover blossoms is most complete.

It is charged that the farmers of the country are leagued together to prevent poor men from getting cheap substitutes for butter. Poor men do not charge this, but the impassioned lawyers of the oleomargarine manufacturers do in their appeals to state and national legislatures. Farmers have not been very conspicuous in schemes to injure poor men. Most of them, at one time or another, have occupied positions in that class. Many of the gentlemen who run counterfeit butter factories are undoubtedly charitable and take genuine pleasure in relieving human want. Their distress about the improverishment of the laboring classes through the purchase of genuine butter may be sincere.

Two things they may not know. One is that the man who eats oleomargarine pays nearly or quite a butter price for it, and the other is that a poor man, above all others, having but little and buying but little wants that little good.

An effort has been made to array the dairymen of the country in opposition to the stockmen upon this question. In this all questions of public policy are left out and only class interests considered. Accepting this basis of argument, of what avail will it be to the stockmen to have oleomargarine sold and unrestricted and dairymen driven out of the business by tens of thousands; and these thousands of energetic men with their millions of capital employed in the stock business, increasing the supply of cattle, hogs and sheep, and thereby diminishing the price? Whatever strikes an unwarranted blow at one legitimate farm interest hurts all. Farmers should stand together in defense of oleomargarine legislation, first, because they should be good citizens and loyal supporters of laws to prevent dishonesty in trade; and, second, because the oleomargarine industry, as conducted, is a serious menace to the agricultural interest. The necessity of pure food legislation, as applied to oleomargarine, is recognized by thirty-two states, which have prohibited the manufacture and sale of that article when colored in imitation of yellow butter. Massachusetts has furnished the model for these laws. The Supreme Court of the United States has declared them to be constitutional. In that decision the following opinion is rendered:

"We are of opinion that it is within the power of a state to exclude from its markets any compound manufactured in another state, which has been artificially colored or adulterated so as to cause it to look like an article of food in general use, and the sale of which may, by reason of such coloration or adulteration, cheat the general public into purchasing that which they may not intend to buy. The Constitution of the United States does not secure to anyone the privilege of defrauding the public. The deception against which the statute of Massachusetts is aimed, is an offense against society, and the states are as competent to proteet their people against such offenses or wrongs as they are to protect them against the crimes or wrongs of more serious character. And this protection may be given without violating any right secured by the national constitution, and without infringing the authority of the general government, A state enactment forbidding the sale of deceitful imitations of articles of food in general use among the people, does not abridge any privilege secured to citizens of

Second-Hand SEPARATORS

the United States, nor, in any sense, interfere with the freedom of commerce among the several states."

This judgment seems to be unassailable. It includes Justice Harlan's famous statement that the constitution of the United States does not secure to anyone the privilege of defrauding the public. Every defender of organized iniquity, when hurt by state legislation, gets noisy about the rights guaranteed him by the national constitution. When afflicted by federal law he becomes a violent advocate of the state rights guaranteed by that same constitution. Justice Harlan, in one sentence, clears an atmosphere befogged with sophistry, with special pleading, with glib talk masquerading in the forms of constitutional argument, and the bitter wailings of men claiming in fact that one of the inalienable rights of an American citizen is the right to defraud another American citizen.

Pennsylvania prohibited, without qualification, the manufacture and sale of oleomargarine. New Hampshire required that it be colored pink The Supreme Court of the United States declared both laws unconstitutional. The decision was well grounded if the question of wholesomeness was not entertained. If the use of olemargarine is not inimical to the public health, its sale should not be restricted in the markets, if sold under its own name and color, any more than the sale of jackknives or Derby hats. Oleomargarine legislation must be upon reasonable lines. Unfair laws to protect farm interests are worse than no laws. They alienate men who think, and the farmers will never be so strong that they can afford to antagonize sound public judgment.

The wholesomeness of oleomargarine is a disputed question. In foreign hospitals its use is prohibited. Hygienic authorities declare it to be less digestible than butter. Samples have been analyzed by the chemists of the agricultural department of New York, which contained from five to twelve per cent of paraffin. This is considered an absolutely indigestible substance, The patents obtained for oleomargarine compounds show them to contain poisonous chemicals. However, it is possible to make oleomargarine which is simply less digestible than butter because it is composed of animal fats melting at a higher temperature than butter and having an inferior flavor.

Prosecutions can be had under the general pure food laws of the states if oleomargarine is so made that it is regarded as unwholesome.

Pure food legislation has greatly restricted the manufacture and sale of that abomination of the markets, known as filled cheese. Skim milk and lard form the bulk of this compound. It has inferior flavor and poor keeping qualities. Its manufacture and exportation nearly ruined our foreign cheese trade. In 1892 there were nearly two hundred factories making it in Wisconsin. The legistlature of 1895 prohibited its manufacture and sale. There is not a factory of this class in Wisconsin to-day, and there has not been for two years. The makers of honest cheese in our state, relieved from the competition of fraud, recovered their courage and are recovering their domestic trade. It takes time to restore our reputation abroad. Canada clubbed filled cheese out of her borders earlier than we, and usurped our place in European markets. She is improving and developing her cheese industry with marvelous rapidity. The Canadian government inspects her factories and takes up questions of cheap and safe transportation. Her people are not afflicted with a fear of the ghosts of paternalism. They believe it to be a province of government to develop the material resources of a country, even though benefits to a particular class of people and through the medium of administrative acts that might cause haggling in the Supreme Courts. The act of Congress which placed an internal revenue tax upon filled cheese of ½ of a cent per pound, has been of great value to our cheese industry. Its purpose is partly defeated in shipments abroad, because stamps are removed. But it was notice to the world that this government wants its food products sold upon their merits and under their own names. It has placed a burden upon the filled cheese industry that has driven a majority of the factories out of the business.

Pure food legislation should be both state and national. State legislation has been generally sustained by the courts, and has been effective. We need a comprehensive national pure food law. The Senate of the United States has recognized this necessity and appointed a special committee of investigation, of which Senator Wm E. Mason, of Illinois, is chairman. This committee has held a number of sessions in Chicago, and is collecting a mass of valuable testimony. The result of the work of this committee will undoubtedly be the introduction into Congress of a bill to prevent food adulteration. It will be argued, as it always has been when this subject has engaged the attention of Congress, that the federal government has no authority to regulate the traffic in food products; that the states alone can exercise police powers; that when Congress has interfered to require that counterfeit food products should be labeled, it has done so through an exercise of its taxing powers, and that only in this way can its authority be exercised. If this proposition is correct, its national pure food law would be worthless. Is it correct? The constitution gives Congress the power to regulate commerce between the states. It reserves to the states, in the 9th constitutional amendment, all powers, not granted to the genera government. But the power to regulate interstate commerce has been explicitly granted to Congress. It is exercised over railroads and in quarantine regulations. No other authority can exercise that power completely. Its powers over articles of interstate commerce is as clearly granted as over the postal service, which it controls without question. It exercises police power by prohibiting the transmission through the mails of mail matter, designed to corrupt or defraud the public. Has it not an equal right under the constitution to prohibit the transportation from one state to another of articles injurious to the public health, and determine what shall be required of manufactures and dealers, who send food products from state to state that are redolent with fraud.

A national pure food law would supplement the state laws and given the food products of this country better standing in foreign markets. It would aid the states which have by stringent laws, stopped the manufacture of adulterants within their borders, by stopping the flood of counterfeit foods that pours into their markets from other states. It may be urged that such a law would make superfluous the dairy and food commissions of the states. If this should prove true, it would conclusively demonstrate the merits of the law. The dairy and food commissions have been organized, not to create offices, but to stop deception and fraud. When deception and fraud in the manufacture and sale of food products shall have been stopped we can afford to pronounce a benediction upon the dairy and food commission and rejoice in the reign of honesty in trade. But a federal law, valuable as it would be, leaves a broad field for state legislation. The domestic trade in food products of the several states is enormous. As long as many men are smart and some men dishonest, the food of the people will be mixed, colored, coated, polished and poisoned, and watchful state care will be needed to limit the evil.

This question of the character of the food supply of 75,000,000 of people is not one to be settled by doctrinaires or hair splitting constitutional lawyers. It will not be settled by all the money and all the brains that are at the command of the manufacturers of counterfeit products. It will not be settled by ridicule, abuse or misrepresentation of the men who till the farms of the nation and produce most of its food. It will not be settled by court decisions, that in effect, deny the statement of Judge Harlan, that the constitution of the United States guarantees to no man the right to perpetrate a fraud. It will not be settled by the pleading of any class for the privilege of plundering somebody. It will not be settled by chemists and experts hired to give opinions. It will not be settled by legislators, who do not care for the public good, and who do not fear public judgment. It will be settled as it is being settled, by the voice of the consumers of food products, demanding laws which compel these products, if sold, to be honest and healthful, and by the American farmer claiming the right of way for the honest products of honest labor.

Choking Cattle.

ED. HOARD'S DAIRYMAN:—Will R. L. Hinman, in speaking of Dr. McIntosh's remedy for choking cattle, in your last issue, and incidentally mentions a remedy of his own, please explain his method fully? Does he mean to put the stick clear through the cow's mouth, and tie string to opposite side of stick? I don't fully comprehend his meaning. He says to tie one end of string around end of stick, put it over head, and put stick well up in corner of animal's mouth, and tie the other end. Where does he mean to tie the end, and to what? J. H. M.

A CHRISTMAS GIFT.
Holstein Bull, Sir Tirania of Valley Mead, (22 mos. old), by Sir Natsey Baker 22413). A prize bull (by Judge Baker, and out of Natsey.) Dam, Tirania 4th 15861 (sister to Tirania 2nd, holder of world's 2-year-old 7 days' butter record, 22 lbs. 8 oz.) by the great prize bull Artis Peer, and out of Tirannia. Natsey's butter record is the largest in the advance registry, 34 lbs. 9 oz. 7 days. Tirannia holds the world's record in public test, 3 lbs. 2 oz. 1 day, for which she was awarded gold medal and $100; 7 days' butter record, 36 lbs. 11 oz. This bull is fit to head any herd in the country. Write for price and further particulars. KARLEN CO., Monticello, Wis.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited.
FRED TSCHUDY & SON. Monroe, Wis.

Cost of Feeding a Cow One Year.

Figures from Filston Farm.

ED. HOARD'S DAIRYMAN:—Occasionally some of the dairymen readers of your paper send you accounts of the cost of feeding their dairy herds; in one such account I noticed, some three weeks ago, a farmer figured out that it did not cost him over $40 per cow per year for feed and maintenance.

This is so far different from my experience that I wish to give you in full, at the risk of tiring your readers, the plan and system, by which the 230 cows of the Filston Farm herd are maintained. I will take the result of the year 1898 as the basis. In preface I will say, we have considered the raising of calves to lactation, and the feeding of the bulls in the expense of maintaining the herd, and we credit the herd only with the milk and cream produced, and the increase of the herd. We do not make any credit for the manurial product, because that is the basis by which the cost of feeding is lowered. Now to take up the account in detail. The expense of the herd for the year 1898 was $16,000, and the gross profit for the milk and cream was $16,300, and the increase of the herd $850. The expense column shows that the cost of feeding was $9,200 or $40 per cow per year. The repairs, sundry expenses, freights, which includes milk tickets on the railroad, taxes, insurance, cans and salaries was $6,800 or $30 per cow per year.

It seems impracticable to feed heavy milking cows on less than 15 cents a day. The heifers and bulls require very much less, the ration, for instance, that is used for the cows is 4 pounds of bran, 4 pounds ground corn meal and 2 pounds cotton seed for the grain; which is not very far from 10 cents per cow per day. The ensilage is about 2 cents and the roughage approximates 3 cents a day. I know of a neighbor of mine, who receives about $400 per month for his milk; he feeds 50 cows and thinks he is making $200 a month profit. When he told me what he was feeding, I told him his grain ration alone cost him $165 a month, his salary account was $100, and his roughage, renewal of herd, taxes, and the multitude of other expenses was, at least, another $100 a month, and that if he cleared $35 per month he was getting a great deal.

I think a farmer that maintains a farm in conjunction with a dairy herd should credit the farm with the product at the market price and charge the herd with the same produce at the same price. I think also he should charge the herd, not only with the labor of his assistants, but with his labor at the farm price. His books would then show him whether he should drop farming and buy his feed, whether he should drop dairying and go to shoemaking, or whether he should continue the whole outfit, if he is making money. I think that most farmers who are in dairy business, are making their milk at a net loss, and my object in placing this article before your readers is to show that on a large dairy farm with everything favorable, with the most economical management, expenses are found to be extremely high. The milk of this herd is sold at 18 cents a gallon, and the herd is cared for and maintained on the order of one man to every 15 cows and the young stock and bulls. But not all of his salary is charged to the dairy, because each man has some spare hours in a day to put on the farm, or as we manage it, when five men are in a stable, two of them between milkings are working the farm. The cows of this herd, for everything in milk, including heifers that had not finished the year when the books were closed, made 5,200 pounds of milk a year, and there were 175 under this heading. The rest of the herd are youngsters and males. I shall be glad to hear from any of your readers on this statement, and stand ready to exemplify any point on which they may wish to be informed. I would add that your paper has been of the greatest assistance to me in my dairy work, and I have no hesitation in following its teachings. A. B. GARDINER, JR.

Baltimore, Md.

Several Utah Queries.

ED. HOARD'S DAIRYMAN:—Please give me a ration from the following: Alfalfa hay, $9 per ton; bran, $15; middlings, $17; pure flax meal, 6 cents per pound; ground oats, $30 per ton; corn meal, $30. Sugar beets and carrots can be bought for $5 per ton. Would it pay to feed them?

Feeding ten cows, pure Jerseys and grades, would it pay to chop all or a portion of the alfalfa used? Selling milk at 12½ cents per gallon, wholesale. Butter is 30 cents at retail. Perhaps it would be more profitable to buy a separator and sell butter instead.

Kindly give me the names and prices of several standard works on dairying, and dairy farm work, from calf to pail.

I have a cow, sixteen years old, just dropped a calf; milked about nine quarts daily. She is in very poor flesh. Is there anything I can do to help her? H.

Salt Lake City.

The first of the above questions is, perhaps, best answered by referring the inquirer to the Kansas experience as reported in the Bulletin, which was published week before last. They found there that alfalfa hay and corn meal and ground kafir corn made an excellent and well balanced ration. Of course corn meal is not worth $30 a ton in Kansas, as it is quoted in Utah, but sometimes the dearest feed is the cheapest. Possibly no one can tell, except by actual trial, whether it will afford more profit to pay $30 for corn meal or $15 for bran to feed in connection with alfalfa hay. Our impression is that the bran and middlings would prove the cheaper, but we are by no means certain. We cannot think either sugar beets or carrots would be a profitable feed, unless they were used as an appetizer and corrector of the system rather than for simple nutriment.

These are questions that cannot be satisfactorily answered in an office, neither will the experience of one man necessarily furnish a rule for the conduct of some other man. It is perhaps nowhere else more true than in feeding dairy cows that circumstances alter cases, and in a very large way each man must be a rule unto himself. By this we do not mean that he should disregard the experience of others or that he should reject the suggestions which may be offered him by others from time to time, but in all such cases pursue the good rule, trying all things, proving all things, and adhering to those which seem best for him. It is entirely within the range of probabilities that these roots may prove beneficial. With this explanation and these reservations, we suggest that our friend try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. alfalfa hay....	18.32	2.20	7.92	.14
4 lbs. bran.	3 52	.50	1.54	.12
4 lbs. corn meal.....	3.56	.32	2.67	.17
Totals	25.40	3.02	12.13	.53

We have suggested corn meal above partly out of consideration for the fact that both alfalfa hay and bran tend to the production of soft butter, and if butter is to be made, as suggested below, the corn meal will tend to correct this tendency on the part of the hay and bran.

Whether it will pay better to sell milk at 12½ cents per gallon or butter at 30 cents per pound will depend, somewhat, on the quality of the milk. If these Jerseys and Jersey grades give milk containing 5% of fat, one hundred pounds of this milk will make about 6 lbs. of butter which, at 30 cents per pound, will come to $1.80. The skim milk and buttermilk remaining, if fed to pigs and poultry, will more than pay the expenses of manufacturing the butter, and we may, therefore, call the above sum the net income from 100 pounds of milk when butter is made. A gallon of milk weighs approximatly 8.6 lbs., which shows, at 12½ cents a gallon, the milk is bringing a little less than $1.50 per hundred; thus leaving 30 cents per one hundred lbs. of milk in favor of making butter.

In answer to the third question, we suggest to our inquirer that he can do no better than to purchase Gurler's American Dairying ($1.00), Wing's Milk and its Products ($1 00) and Henry's Feeds and Feeding ($2 00). These books can be had at publishers' prices from this office.

It is more than possible that the trouble

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

with the old cow is poor teeth. Have a skillful veterinarian examine her for this or any other trouble and follow his advice. Meantime do not require this cow to eat coarse, dry fodder, but give her something choice, easily masticated, easily digested and put before her in an appetizing way.

Wisconsin Cheese Makers' Association.

ED. HOARD'S DAIRYMAN:—The program of the eight annual meeting of the Wisconsin Cheese Makers' Association, which will meet in the Assembly Chamber of the State Capitol building in the city of Madison, on the 7th, 8th and 9th days of February, 1900, will give notice of many features that will prove of special interest, not only to the practical Cheddar cheese-maker, but also to those interested in the manufacture of foreign and fancy cheese of all kinds, including addresses that will be of intense interest to the patron and dairy farmer.

One of the new features will be the educational cheese contest, for which the Association offers gold, silver and bronze medals, in addition to the splendid pro rata fund, which has been so generously furnished through the liberality of the dealers and manufacturers of dairy supplies. A skilled, practical cheese maker and an expert cheese instructor will follow the judges in their word of scoring the exhibit; taking notes of the criticisms made by the judges, and writing back the faults, if there be any, to each exhibitor; giving instructions, suggestions and methods whereby the make in each instance may be improved upon.

The morning session of the second day will be devoted to the cheese makers' class, consisting of eight practical lessons in cheese-making by eight practical cheese makers, covering the entire process of manufacturing from receiving the milk at the weigh can to the boxing and shipping of the finished product.

Dr. L. L. Van Slyke, chief chemist of the New York Experiment Station, will address the convention on the evening of the second day, on a topic of special importance to cheese makers at this time, namely: The Influence of Temperature and Moisture upon the Composition of Cheese During Ripening.

Mr. A. J. Glover, cheese expert of the Minnesota Pure Food Commission, will treat of a subject of interest to proprietor and patron alike.

The noted pen-and-ink cheese maker, Mr. J. H. Monrad, Assistant Dairy and Food Commissioner of Illinois, will be there as usual, and discuss upon some things in Swiss, Brick, and Limburger cheese making.

Nineteen others, all special-purpose men in their various lines, have been booked and will contribute addresses and papers during the three days' session of this meeting, making this the most instructive and entertaining program ever offered to the cheese makers and dairymen of the Badger state.

Watch the columns of the dairy press for the complete program at an early date. For information regarding excursion railroad rates, special hotel rates, programs, entry blanks and annual reports, address the secretary. U. S. BAER, Sec'y.

Madison, Wis.

Creamery in West Texas—A Texas Feeding Inquiry.

ED. HOARD'S DAIRYMAN:—I am putting up a small creamery but have no experience in running one. Must I get a person that has experience in running one, and if so, can you refer me to some one that I can get, that wants to come to west Texas?

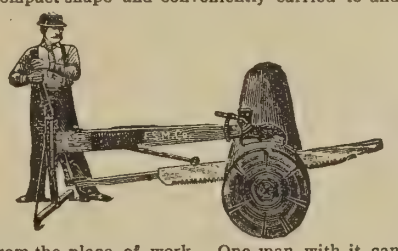
Will you give me a balanced ration of the following feeds: Cane (sorghum) is worth $4 a ton; corn fodder, $5 a ton; kafir corn fodder, $4 a ton; Colorado grass hay, $8 a ton; corn, 30 cents a bushel; wheat, 60 cents a bushel; oats, 30 cents a bushel; cotton seed, 16 cents a bushel; cotton seed oil meal, $20.50 a ton; bran (wheat), $18 a ton; kafir corn heads, $10 a ton.

Merkel, Tex. W. N. M. G.

Of course where one has no experience with a creamery, the services of a man who has had such experience are very valuable, but if one is a careful student and is willing to follow directions he may be able to get along fairly well even at first. The proper way to get into correspondence with persons who have had such experience and who are willing to go to Texas, is to insert a small advertisment in our reading notice columns. Meantime and in any event, a creamery man whether experienced or inexperienced will find the book, Gurler's American Dairying, very helpful. It costs only $1.00 and may be had from this office.

We suggest to our friend that for his purpose he could probably do no better than mix two parts of bran with one part of ground corn and one part of cottonseed meal, all by weight and not by measure, and feed from 6 to 10 lbs. of this mixture daily, one-half at night and one-half in the morning, and then give his cows all the roughage, including some of the hay, that they will eat. One of the most important lessons in feeding is to learn that it is unwise to feed all cows alike. On the contrary they should be fed according to their respective abilities to utilize feed. One cow may be able to make profitable use of 10 lbs. of the grain mixture above suggested, while another one can not use even 6 lbs. to any advantage.

The Schmidt Cure for Milk Fever.



ED. HOARD'S DAIRYMAN:—In your last issue you ask for further information regarding the use of the Schmidt cure for milk fever. While we advertise this remedy in your paper, still I should like to bear witness as to the results. Since May there has been eight cases of milk fever in the Filston Farm herd, and we have saved seven, and no doubt the eighth could have been saved had it been attented to in time. A neighbor of mine, Mr. G. A. Mays, borrowed our box and saved two, all the cases he had. Dr. Jos. P. Grogan, veterinarian of Ashland Ave., Baltimore, told me he had attended three cases with complete success, and Dr. A. W. Clement, a state veterinarian, also told me he had not lost a case since this cure had been made public. I think you will agree with me when I say this cure is nothing short of marvelous, and I only regret that the farmers at large have overlooked its great value.

Baltimore, Md. ASA B. GARDINER.

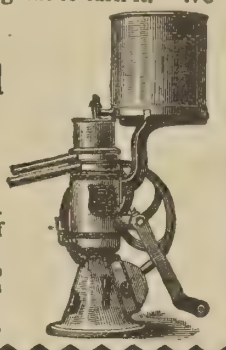
ILLUSTRATION.

The season of the year is at hand when farmers find time for work in the woods and wood-lot. Sawing wood has always been one of the bugbears of the farmer's life, and under ordinary circumstances there truly is no more back-breaking, disagreeable work on the farm. The inventive genius of America, which has done so much to lighten the manual labor, has not neglected this branch of the work. The late Mr. Marvin Smith perfected a sawing machine with which one man can do the work of two, at least 20 per cent easier than the old way.

Mr Smith's invention is the Folding Sawing Machine, an illustration of which is shown herewith. The machine weighs only 41 pounds, and is so constructed that it can easily be folded into compact shape and conveniently carried to and

from the place of work. One man with it can saw down a tree and then saw it up into wood of any length, doing, as we said, as much work as two men can with any other saw, or as three men can with axes. The operator always stands erect no matter in what position the log may lie. The machine can be easily and quickly adjusted so as to saw the log perfectly square in two.

We take great pleasure in recommending this machine to our readers and suggest that they send to the Folding Sawing Machine Company, 55 North Jefferson street, Chicago, for their free catalogue and testimonials. We do not know of any labor saving device that is more appreciated by the man who works in timber. It is by taking advantage of such appliances that the progressive man saves time, lenthens his days, and gets more pleasure and profit from them.

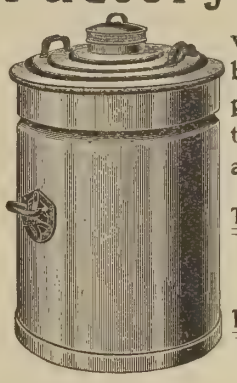


A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

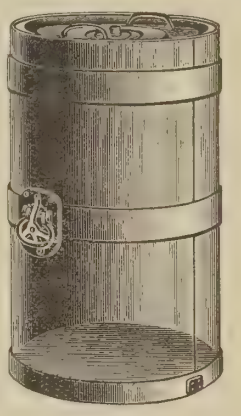
to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.



We have not space here to tell you why the Empire machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

Factorymen



who guarantee their cheese and butter, should see to it that their patrons are supplied with cans that can be kept absolutely clean and easily inspected.

EMPIRE STATE.

The EMPIRE STATE CAN is the best because it is ventilated, and the milk cannot slop out.

The UNION CAN is the best old style Factory Can. Send for special circular and price list.

Made by STANDARD OIL CO.

Indiana State Dairy Association.

ED. HOARD'S DAIRYMAN:—The tenth annual meeting of the Indiana State Dairy Association convened at Cambridge City, under unusually favorable weather conditions. The hall was crowded every session with a good attendance of members from a distance, as well as a large number of patrons and dairy farmers from the surrounding country.

"Mixed Farming" was the subject prepared by T. S. Nugen, of Lewisville. He has followed for a great many years, grain growing, but finds that the addition of a small dairy herd is a great help, both in maintaining the fertility of his farm and helping the cash income.

"Dairy *versus* Beef," by C. B. Benjamin, of Leroy, created considerable discussion at this time, when both beef and dairy products range so high in price. Mr. Benjamin estimates that the average beef cow is worth $40.00; her calf, at a year old, is worth $20.00; a good average dairy cow he figures to be also worth $40.00; at 18 cents per pound for butter, she will produce $48.60 worth of butter a year; her calf, at a year old, is worth $14.00; the butter milk and skim milk is worth $6.48, making a total income for the year of $69.08, but it requires a good deal more labor to care for a dairy cow and the milk, every day for 365 days in the year. So he allows for this labor $17.00.

If the feed costs $24.30, making a net cost of $41.30, the produce $69.08 income, leaving a net income of $27.78, compared wit h the beef cow's net income of $20.00, showing a balance of $7.78 in favor of the dairy cow. An animated discussion followed the delivery of this paper.

H. N. Barker, a young man who is working his way through Purdue University as dairyman at the college dairy, gave some personal experiences in feeding skim milk to pigs, prior to his coming to college. He found that pigs running at large would drink but a small quantity of skim milk, but when confined in a small pen on a ration of skim milk, bran and shorts, equal parts, and some corn, they made rapid gains in the feeding period, and a net gain of one dollar and eighty odd cents, per hog. He bought all of his skim milk, shorts and corn, so that his figures are accurate. From reports of experiment station work, he found that the smaller quantity of skim milk, say, three pounds of skim milk for each pound of grain fed, makes a larger and more economical gain than the large quantity, say seven to nine pounds for each pound of grain fed.

S. B. Woods, of Lottaville, discussed sorghum, oats and peas as desirable crops to grow for summer feed. He considers them well worth the time and labor expended in growing them. Oats and peas should be planted as early in the season as the soil will permit, that they may get a good start before warm weather. In feeding the sorghum, care should be taken that it is not fed too early, as the sap is sour when young.

Professor T. F. Hunt, of the Ohio State University, discussed in a clear, forcible manner, the place of corn fodder in the feeding ration. He says that animals sometimes suffer for the want of ash and mineral matter in their feed, and called attention by charts to the high per cent of ash in corn fodder and some other coarse feeds, compared to the low amount in bran and other feeds and stated from this standpoint that fodder must be considered as part of the ration. Also that while in a natural state, animals eat a bulky ration, but this does not necessarily prove that under our modern environment, it is cheapest and best. On the other hand, Illinois experiments go to show that animals do not live and do well on a very concentrated ration. The young calf does well on milk, but after a year old, it drinks immemse quantities of milk, and even then looks as if starved to death, and even becomes sick. The addition of a little coarse feed to the ration, giving something to form a cud, resulted in a marked improvement. German experiments show that only half of the digestible nutrients in clover hay are required to masticate and digest it, while in 78 pounds of corn, only 8 pounds are required to perform the work of mastication and digestion, leaving 70 pounds available for work. At the present prices there is a possibility that some dairymen in their attempts to furnish a bulky and cheap ration, are feeding too much fodder or timothy hay. For instance, the following ration:

Timothy hay	10 pounds.
Corn stover	10 pounds.
Corn	5 pounds.
Bran	2 pounds.
Oil meal	3 pounds.

making a total of 30 pounds, costing 13.3 cents.

The standard ration advocated calls for 26 pounds of dry matter, 16 pounds of digestible nutrients and 2 pounds of protein. This ration has five pounds more than the standard calls for. By cutting this ration down, leaving out the timothy hay, and adding five pounds of corn meal, and leaving the other grains the same, the bulk is reduced to 26 pounds. The cost is also reduced to 11.8 cents, thus giving the animal nearly what she requires and still an amount that she can conveniently handle.

David Shellenberger, of Dublin, a patron of the Cambridge city cheese factory, showed in a clear and forcible manner the advantages that a cheese factory gives to a community, relieving as it does the housewife of much labor in caring for the milk and butter, and it also gives larger returns for the milk; this factory, paying last month, 23 cents a pound for butter fat, while the local butter market was paying 15 cents a pound for butter.

The evening sessson opened with the President's address in which he reviewed the general dairy conditions, cautioning the dairymen not to let the similarity of each day's work keep them in a rut, to get out and look around after new ideas and methods.

He says the Bulletin of Statistics shows the average income from the dairy cows of the state to be so close to the cost of production that if there are a few of them making a profit, there must, of nccessity be a great many who are making milk and butter at a loss, otherwise the average would not be so low.

G. P. Newsom, of Valley Mills, a Purdue University agricultural graduate, who is devoting his energies to the production of butter and cream for the city market, spoke on he "Why of a Special Training for the Dairy." He says that while the herd is in a good healthy condition, every cow on her feed, or while the complicated engine is working smoothly, any body can run them. But when the injector "bucks", the pump gets out of order, or something else is wrong, then the man with the training has the advantage. Ten chances to one, his foresight has prevented many of these little annoyances.

Mrs. Kate M. Busick, of Wabash, presented a paper on the "Evolution of the Dairy Cow."

This was followed by a discussion on the "Conformation of the Dairy Cow," by Mortimer Levering, of LaFayette. After a short discussion, the audience adjourned to the street, where a fair type of the dairy cow was in waiting. Mr. Levering then pointed out her strong and weak points, as a typical dairy cow.

After the reports of the committees, and election of officers, Mr. S. J. Taylor, of Logansport, discussed "Moisture in the Curing Room," advocating the sub-earth duct as the most practical solution and one of value.

Professor C. S. Plumb gave a general presentation of the attempts made in trying to furnish a practical milking machine. He found from extended research in the Patent Office reports that over 60 patents had been taken out on so called milking machines, that some of them, as was remarked, were more ludicrous than some of the flying machines, and yet there has none of them stood the test of time and the practical every-day conditions, which such machines must comply with. Many of them would draw milk when the udder was full, but nearly all of them failed to milk clean excepting when the cow was an unusually easy milker. Some of them were irritating, and all of them were more or less difficult to clean.

"The Why of Milk Testing," was a practical demonstration with the Babcock test, by H. E. VanNorman, of LaFayette, in which he showed the method of operation and gave some examples of the value of the test in the selection of cows and its justice and accuracy as a means of apportioning dividends at the cheese and butter factory.

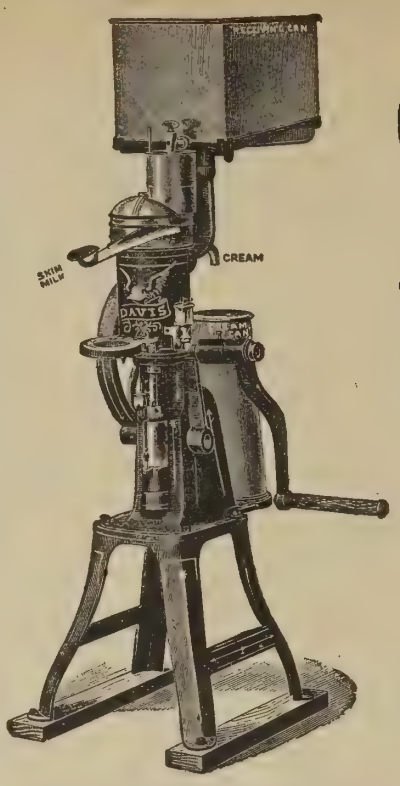
The election of officers resulted as follows: President, C. B. Benjamin, of Leroy; Vice President, J. V. Shugart, of Marion; Secretary-Treasurer, H. E. VanNorman, LaFayette; which with J. J. W. Billingsley, of Indianapolis, and Professor C. S. Plumb, of LaFayette, constituted the Executive Committee.

T. F. Gallagher, of the Chicago butter market, scored the butter. He said that the quality was unusually high and that 20 such tubs from Indiana would make strong competition at the national butter show at Lincoln. He placed the Hagerstown creamery first, with a score of 97¾; Manchester creamery, 2nd score, 97; Williamsburg and Prairie Creek creameries, 96 each. The average for 11 tubs shown was 95.02. Of the dairy butter there was a very small show, C. B. Benjamin, of Leroy, getting first, with a score of 97. C. Lamont, of Joppa, 95½.

Cheese—Boyd and Drischel, Cambridge City, first, 95½. O. J. Richardson, Lewisville, 95.

Taken altogether, the meeting was an interesting, profitable and successful one.

H. E. VANNORMAN.



Granite State Dairymen's Association.

Another meeting of this Association has come and gone pronounced by every one a success, as was, also, that of the Board of Agriculture, the two holding conjointly as has been customary for several years.

The Town Hall at Peterboro being the place, and great is the pity that such good meetings have to be advertised as *annual* winter meetings on account of the smallness of the state appropriation for the purpose.

As the DAIRYMAN has asked only for report of dairy meeting, we will only mention the names of the speakers belonging particularly to the Board of Agriculture. Perhaps the leading paper was given by Hon. H. C. Adams, Pure Food Commissioner of Wisconsin. "Farmers and Taxation," by a member of the Board, Willard Bill Jr., Westmoreland, and "Principles of Stock Breeding" by Prof. Burkett, of the State College; both were excellent.

Prof. F. W. Rane, also of the State College, gave a paper on "Horticulture." "Farm Sanitation" was ably treated by Dr. Irving A. Watson, of the State Board of Health. President of the Board of Agricul-

ture, Hon. Joseph B. Walker, gave a characteristic paper on "The Agricultural Outlook."

DAIRYMEN'S DAY

opened with clear weather, good roads, good audiences (for New Hampshire,) and a *trowded program*, resulting from an attempt by the officers of the Association to condense as much of three sessions as possible into forenoon and afternoon, for the benefit of those desiring to return home before evening.

President Waterhouse commenced his Annual Report by formally accepting his election. He then, being father of the creamery movement in New Hampshire, and dairy instructor at the state college, gave a history of associated dairying from the start. Also that the height of knowledge in dairying was not yet attained, and skillful production of dairy goods would never be much in fear of over-production. Great skill in testing is needed in order to give justice to patrons.

Butter with too much water in it would shrink on the dealers' hands, and was a fraud if it much exceeded 10%. He alluded to the rapid increase in the demand for cream to be consumed in private families.

Cream varies from 8 to 27%, and the word cream has no fixed meaning on that account. There should be an effort for fixing the standard of per cents and prices.

Prof. Wm. H. Caldwell, Secretary and Treasurer of the American Guernsey Cattle Club, gave an interesting address on the Guernseys, and a description of the Island.

The Island is only nine miles long and six wide and supports 36.000 people with its agriculture. There are only 2½ acres of land for each cow kept and farming is so intensive that every inch is improved and land rents for $300 a year per acre.

Only five cows on the average are in a herd and they are largely cared for by women and children.

The first Guernseys were imported by Prince and kept on Cow Island in Lake Winnipesaukee, N. H. The next importations lodged near Philadelphia.

Good acclimated Guernseys are still bred near both these localities.

The two strictly dairy papers seldom equalled were "Economical Dairy Foods," by Prof. Joseph L. Hills, Director of the Vermont Experiment Station, and "The Dairy Type," by Prof. T. L. Haecker, Professor of Dairy Husbandry, University of Minnesota.

One of the things most interesting to farmers said by Mr. Hills was that, asking the cow five different times whether it was most profitable to husk and grind corn or cut it, ears and all into the silo, the cow said, every time, in the pail and in the churn, cut altogether into the silo.

Prof. Haecker's illustrated talk showed the "undairy" as well as the dairy type. This lecture will be published in our report with illustrations.

The exhibit was better than was anticipated, all special supply prizes being left out for this year. It was in charge of W. D. Baker, of Quincy, who is re-elected as Superintendent of Exhibit, as was practically the old board of officers.

Returning to the hall the audience listened with much interest to the report of the expert who judged the butter and cheese, O. Bent, of Boston. The report was as follows:

Whole number of exhibits of butter, 83; average score, 93. The following awards were made: Class A, dairy tubs—First, A. B. Hough, Lebanon, score 94; second, D. H. Foster, Lebanon, 93; third, S. T. Noyes, Colebrook, 92½.

Class B, dairy of mixed herd—First, F. H. Sanders, Laconia, 95⅛; second C. G. Britton, Keene, 94½; third, John M. Pulsifer, Campton, 93.

Class C, dairy prints—First, Gordon Woodbury, Bedford, 97¾; second, W. C. Pulsifer, Campton, 954¾; third, Miss Helen T. Hutchins, Lebanon, 94½.

Class D, creamery tubs—First, Chester Dairy company, Chester, 97; second, Cornish creamery, Cornish Flats, 96½; third, Hillside creamery, Cornish, 95½.

Class E. creamery prints—Cold Stream creamery, Bedford, 98; second, Sanborn's creamery, Deerfield, 97; third, Suncook Valley creamery, Suncook, 95.

Granular Butter—First, H. C. Smith, Holderness; second, Peterborough creamery, Peterborough; third, Suncook Valley creamery.

Sweepstakes—Cold Stream creamery, Bedford, score 98.

Dairy Cheese, plain—First, H. C. Smith, Holderness; second, J. W. Pulsifer, Holderness; third, W. C. Pulsifer, Campton.

Sage Cheese—First, D. P. Pulsifer, Campton; second, J M. Pulsifer, Campton; third, J. W. Pulsifer, Holderness.

A gratuity was recommended to Peterborough creamery for the fine display of fancy butter.

After the announcement of this report the following resolutions were presented: That the government tax of two cents on oleo be put up to ten cents a pound; a resolution of thanks to the town of Peterborough for the use of the hall; to the ladies of Peterborough Grange for the excellent dinner, and to Secretary Bachelder and his associates for their efforts to suppress the sale of oleo.

These were all unanimously adopted. E. M. Slayton, of Manchester, was present and presented the resolution in regard to raising the tax on oleo, and said he thought that imitation butter had kept at least $500,000,000 per year out of the hands of farmers in this country.

The meeting has been one of the most interesting and instructive as well as one of the most largely attended, ever held by the association, and in this community, as well as in the state at large, will be productive of great good.

The annual meeting of the Dairymen's Association was held yesterday, and officers elected as follows: President, C. H. Waterhouse, Durham; vice presidents, G. H. Wadleigh, Tilton; and W. H. Sisson, Cornish; secretary, J. L. Gerrish, Contoocook; treasurer, N. J. Bachelder, Andover; superintendent of exhibit, W. D. Baker, Quincy; trustees, Hermon Noyes, Rockingham county, Atkinson; A. B. Locke, Strafford county, Barrington; J. W. Sanders, Belknap county, Laconia; Blake Felsom, Carroll county, Wolfeborough; George M. Putnam, Merrimack county, Hopkinton; E. M. Slayton, Hillsbourough county, Manchester; Willard Bill, Jr., Ch shire county, Westmorland; Charles T. Rossiter, Sullivan county, Claremont; E. E. Bishop, Grafton county, Bethlehem; Albert Corbett, Coos county, Colebrook.

Ohio Jersey Cattle Club.

ED. HOARD'S DAIRYMAN:—The nineteenth annual meeting of the Ohio Jersey Cattle Club will be held at the Hotel Chittenden, Columbus, Ohio, on Tuesday evening, January 9th, 1900, at 7 o'clock p. m. A full attendance is desired and you are cordially invited to come and bring your neighbor breeders. A beautiful souvenir is being prepared for the occasion, and you will be disappointed if you miss it. A. T. DEMPSEY, Secy.
Columbus, Ohio.

An Expression of Opinion.

ED. HOARD'S DAIRYMAN:—Inclosed will find 25 cents; please send me HOARD'S DAIRYMAN for three months. Commence with Nov. 3rd, if you can. I never saw a copy until this week, and I find it rich in protein, carbohydrates, etc., but not a trace of dry matter. But the dry stuff I can get elsewhere. F. M. COFFIN.
Atlanta, Ga.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

DIARRHŒA.

In reply to an Illinois query:

The cow is no doubt suffering from indigestion. Drench her morning and evening with two quarts of slippery elm porridge, or pure flax seed, or Iceland moss, or you may change to the one she seems to relish the most. Don't force her too much, but use intelligent and good judgment. Put into each, 1½ ounces of tincture of ginger. If this does not arrest the diarrhœa in two or three days, put one ounce of tincture of opium into the drench. Be careful not to stop the looseness too suddenly. Let her nibble anything she likes. Give her 4 or 5 lbs. of clean carrots, raw, or the same of good, sweet turnips, or both, as she may seem to relish; cut them quite fine. Apart from these, give her one quart of strong caraway seed tea, and put two ounces of old whisky into it. Use her kindly, and don't attempt to force any kind of food upon her.

WORMS IN HORSES.

What remedy for worms in horses? Will copperas kill them, and is there any objection to its use? T. O. S. JR.
Washington, D. C.

ANSWER.

Sulphate of iron, green copperas, is good for worms, and will do no harm if given in two dram doses, mixed up with syrup of any kind. This is for lumbrici, viz., large, round worms. For ascarides, pin worms, no stomach medicine will be of use. Use injections of linseed oil and aloes, one ounce of pulverized aloes to the quart of warm oil. Use a long nozzled syringe. Don't wound the membrane of the anus.

FOR DISHORNED COWS.

Do you know anything to place on cattle after they have been dehorned? L. F. B.
Cincinnati, O.

ANSWER.

I don't know just what you wish. It there is ulceration, you need a qualified man to look to the cases. If you mean just the wound, immediately after dishorning, nothing is better than compound tincture of myrrh and aloes ointment.

VERMINOUS BRONCHITIS.

I have a calf about 6 weeks old that seems to have something in its throat; it coughs and seems as if it was going to choke, and bawls a little after it drinks its milk, but eats its hay alright. W. A.
Tempe, Arizona.

ANSWER.

You have verminous bronchitis. Feed liberally upon any of the cakes, as linseed, rape seed, etc., and roots. Put into this sulphate of iron 4 ounces, gentian 4 ounces; 4 ounces of this and a tablespoonful of salt to ten calves, if four months old, and gauge according.

GARGET.

One of my cows has at different times a hard swelling in one-quarter of her udder; slightly feverish. It usually lasts three days, the second day giving a good deal of tough stringy milk. the third day seems to get well. It does not always come in the same part of the udder. Only seems to affect the swollen part. At present she is dry, but one-quarter of udder is affected as stated.
Pasco, Wash. MRS. H. K. W.

ANSWER.

You give a funny condition, indeed, to me. Immediate full dose of physic and repeat in six days, if needed. Use strong saturated tincture of iodine upon the exact spot and no where else. After the physic is through, give two, only, drams of nitre each morning for ten to thirty days, if needed. This will not hurt the milk at all.

LAME COW.

I have a cow which has been lame since last July. Lameness started in the heel of the hind foot; gathered, broke and run a little and then healed, and the cow seemed better for a short time, but instead of going away, the swelling gradually run up the leg, until it reached the hock joint. About three weeks ago, it gathered and broke again. There has been no mud or filth for her to get into. T. H.
Norwich.

ANSWER.

There is evidently some foreign substance in the leg, a sliver or something. If not this, you have a case of scrofula. You need a personal and intelligent examination, so as to come to a true diagnosis. There is nothing else to do at present.

Horse Owners! Use

GOMBAULT'S
Caustic Balsam
A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

ANIMAL GERMICIDE COMPANY, 189 Chambers St., New York.

Would Load 13 Trains.

265 Cars of Oleo Made in Chigago Last Month.

Four oleomargarine factories in Chicago turned out 106,201 fifty-pound tubs of oleomargarine last month.

In pounds, this aggregates 5,310,000.

This oleomargarine would fill thirteen trains of twenty cars each, amounting to 265 cars.

These cars would make one train one and two-third miles long.

Placed along side each other the tubs would reach thirty miles with their sides touching.

It would require at least 1,250 average creameries to turn out this quantity of butter during this season of the year. Allowing an equal output for the remaining twelve factories of the country (a conservative estimate) and we have an output of oleomargarine for November, aggregating 212,000 tubs, equal to the make of 2,500 creameries.

At the outside there are not more than 10,000 creameries in the United States. Therefore, the product of sixteen oleomargarine factories at present is equal to the output of 25% of the creameries of the country.

In five months this year, 1,796 retail licenses to sell oleomargariue have been issued in northern Illinois, compared with 1,737 for the entire twelve months of the previous fiscal year, and 1,051 for the whole of the fiscal year preceding.

The above figures are certainly astounding. At the present proportion of increase in the manufacture and sale of oleomargarine, it will be but a short time before consumption of the imitation will be greater than that of the genuine article. It is conceded that the output of oleomargarine, will be over 100,000,000 pounds this year. It may be 125,000,000. If it is, this will furnish 10% of the butter eating population with oleomargarine. Take away the rural population which makes its own butter and confine the average to the populace of the smaller cities and large markets and one out of five butter eating people must consume oleomargarine.

Let the production of oleomargarine double in the coming two years as it has since 1897, when the November output was only 47,394 tubs, and one out of three city people will have oleomargarine instead of butter. Permit the increase to be as great the next thirteen years as it has been since 1886, when the government first began keeping a record of the production, and half the people in the cities and larger towns will be eating oleo.

This would mean the closing up of at least 5,000 of our 10,000 creameries, and the wrecking of the entire dairy supply, separator and machinery business, and the cutting off of an income of at least $50,000,000 per year, which goes to the dairy farmers of the United States.

Below we print a statement of the November production of oleomargarine in Chicago for the past thirteen years, expressed in 50-lb. tubs:

Year.	*50-lb. tubs.*
1886	30,700
1887	31,100
1888	38 420
1889	44,391
1890	52,235
1891	64,607
1892	81,442
1893	87,175
1894	78,437
1895	62,909
1896	40.342
1897	47,394
1898	70 263
1899	106,201

In the city of Chicago to-day, there is very little butter being consumed. Hundreds of dealers are guaranteeing oleomargarine to be pure butter. Poor grades of the bogus article are being sold at 30@32 cents per pound. The people are absolutely at the mercy of the thieves and robbers, who are disguised as butter dealers. They can spare thousands of dollars of their ill-gotten gains to bribe public officials and donate to campaign funds to insure political protection. And the people of Chicago pay the bills.

How long is this thing going to last? Either oleomargarine or butter must succumb very soon. Unless there is some change in conditions, it will be butter, as there is absolutely no chance for the honest and genuine article under present conditions.—*Chicago Produce.*

National Creamery Buttermakers' Association.

ED. HOARD'S DAIRYMAN:—President Boardman has appointed the following transportation committee: J. H. Snyder, New York City; Owen McCusker, Boston, Mass.; W. R. L. Fullerton, Philadelphia, Pa.; E. L. McAdam, Chicago Ill.; and J. S. Moody, St. Paul, Minn.

All of the above gentlemen are so well and favorably known among commission men, supply men and buttermakers', that it is needless to say any more. They will endeavor to obtain the most favorable R. R. rates from their respective territories and those intending to go to the Convention are requested to communicate with the nearest committee man when they have made up their minds.

Right here we want to urge secretaries as well as managers of creameries to attend the convention, as it will be of as much interest and value to them as to the buttermaker. E. SUDENDORFF, Sec'y.

Elgin, Ill.

Infectious Abortion of Cows is a Germ Disease.

ED. HOARD'S DAIRYMAN:—A most remarkable condition exists as regards abortion in cows. Many dairymen of long experience seemingly are not familiar with the cause of what is often the most serious loss to them. The class of abortion most detrimental to dairymen is that termed infectious. This class has been proved to be infectious by taking wads of cotton soaked in the fluids of cows, which had suffered from abortion of an infectious nature, and placing them in the vagina of pregnant cows. Abortion followed in from twelve to twenty days. A similar experiment tried with the fluids from cases of accidental abortion did not produce any bad results. In the light of such proof, contagious abortion is classed and should be treated as a germ disease.

In the modern conception, disease is a disturbance of the normal condition of some one or different parts of the body; the reaction to an unaccustomed influence

According to the germ theory, the foreign influence producing this disturbance is the existence of a germ in the interior of the animal body. When germs vegetate in the animal body, there likewise occurs a struggle for life between the germs and the animal cells.

The symptoms of abortion are evidence that the struggle exists, and it must terminate in the victory of one or the other side. If the battle is won by the animal cells, the disease is checked, and health is restored to the animal. While if the germs win, the animal will remain diseased and will show it by symptoms of abortion (occurring only in the last stages of the disease) such as enlargement of the udder and swelling of the vulva. It is not long after these symptoms appear that abortion takes place.

All cows in herds troubled with infectious abortion are certain to be diseased; that is, they are already, or soon will be, infected with the germs of abortion, if not prevented. But there are cows having a very strong constitution, that can contain abortion germs (providing they do not outnumber the animal cells) and carry their calves full time, without showing any signs of disease, except a little weakness on the part of the calf, and a shortage in the flow of milk, which is often overlooked or accounted for in some other way. Even the afterbirth of such a cow, if carefully examined, will be found in many instances to be diseased; but you will also notice in such cases that the navel cord is not diseased, for had it existed in the navel cord, the cow would certainly have failed to carry her calf full time.

The germs very often accumulate in the navel cord, causing it to become so diseased as to entirely shut off the circulation between the mother and fœtus. When this takes place the fœtus either dies, or becomes distressed, and causes such a disturbance and contraction of the womb, that the mother soon expels it, usually dead, but sometimes alive.

The nourishing materials in the blood of the mother are taken into the circulation of the fœtus through the navel cord; and not only does the fœtus take nourishment from the mother's blood, but it will also take germs of abortion, which fatally effect the fœtus.

These germs can be found in the affected mother's blood, in the afterbirth, and in the bowels of the fœtus It is for this reason that the afterbirth is so often retained, and prematurely born calves nearly always die of the scours.

During the later months of pregnancy the membrane and other appendages of the fœtus are constantly liable to get out of order, and by reason of sudden movements of the fœtus, caused by an interrupted circulation of the blood (due to germs) the navel cord is especially apt to become twisted or knotted, resulting in the death of the fœtus.

In any case of abortion not due to those causes originating in the system of the mother, you will have to direct your attention to the fœtus, as to the fœtal cause of abortion.

It may be stated as a general proposition that anything that will kill the fœtus, will produce abortion. If the fœtus is not at once expelled, it will soon decay, and the decaying fœtus, acting upon the nerves of the womb, produces contraction and expulsion.

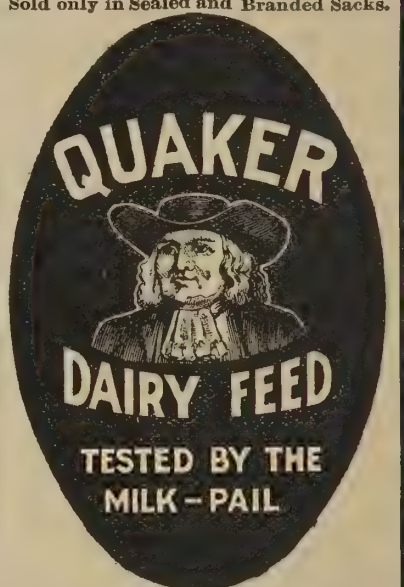
We must never lose sight of the fact that the living animal body is not a mere hot bed in which germs can multiply without hindrance. If the germ can multiply within the animal system, they can only do so by overcoming the opposition on the part of the animal cells.

The healthy animal body possesses various means of protecting itself against the entrance or multiplying of germs. The serum of the blood, particularly if free from disease, has a direct germ killing power. The blood is composed of red and white cells The white cells of the blood, if sufficient in number, have the power of destroying the germs of abortion, but unfortunately in this disease there is a lack of white cells.

For this reason, if a dairyman wishes to eradicate the disease of abortion from his herd, he can do so by using judgment in selecting a remedy, which, when administered, will not only increase the white blood cells, enabling them to overcome the germs of abortion, but also having a tendency to render the animal immune; and thus by assisting nature, which requires but very little assistance in the right way, the dreaded disease can be overcome and entirely wiped out of any herd, it matters not of how long standing.

Following abortion is often a train of secondary troubles, caused by the weakened condition of the animal system, prominent among which are barrenness and tuberculosis. The greatest insurance against these diseases is obtained by freedom from abortion. A herd afflicted with abortion is never healthy. D. Roberts, D. V. S.

Waukesha, Wis.



NO crop can grow without Potash. Every blade of Grass, every grain of Corn, all Fruits and Vegetables must have it. If enough is supplied you can count on a full crop—if too little, the growth will be "scrubby."

Send for our books telling all about composition of fertilizers best adapted for all crops. They cost you nothing.

— BANKRUPT SALE OF —

A No. 1 DAIRY FARM

Said farm lies in the Mill Creek Valley, 7 miles from Richland Center, 1 mile from Boaz and a first-class cheese factory. It consists of 479½ acres under fence and seeded down; over 200 acres under plow. Said farm must be sold to close out bankrupt stock. For further particulars address D. G. JAMES, Trustee, Richland Center, Wis.

ILLUSTRATION.

In the past few years the use of gasoline engines has increased to such an extent that they have practically superceded the steam engine for all purposes requiring a compact, easily operated and economical power. This is particularly noticeable in agricultural pursuits. Every stockman, dairyman or farmer can now obtain the same results with a gasoline engine that he did with his cumbersome steam rig, at one-fifth of the cost of operation. Every well appointed farm should now have one of these engines, as they can be used for pumping water, grinding feed, sawing wood, or in fact any work requiring power. They are far in advance of a wind-mill, being always ready for use at any moment.

The Bates & Edmonds Motor Co, of Lansing, Michigan. whose advertisement appears on another page, make a specialty of small gasoline engines for any purpose whatever, and particularly "power for the farm." The accompanying half-tone represents the 1½ h. p. engine manufactured by this company.

The engines manufactured by this company are guaranteed to be high grade in every respect, and are designed with the view that each size will more than develop the h. p. at which it is rated. For instance, the 1½ h. p. shown in cut will do 2 h. p. work, and the other sizes in proportion. The electric igniter is used on all engines, but in cases where it is so desired, the hot tube will be attached.

All engines are shipped with a complete outfit of extras for setting up and running them, which is a very satisfactory feature, as oftentimes the purchaser starts them at a long distance from any base of supplies and is at a loss for some small necessary connection. This company also manufacture a full line of gasoline motors for automobile and marine purposes, and are ready at all times to furnish estimates on this class of work. Dealers having a call for a first-class gasoline engine can secure prices, terms and full information by addressing the manufacturers, Bates & Edmonds Motor Co., Lansing, Mich.

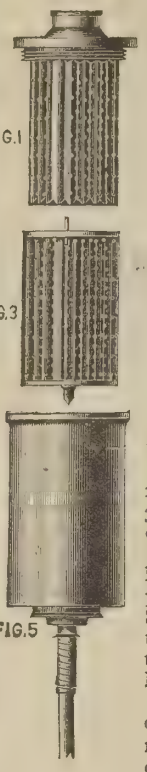
THE oscillating sweep shown in above cut insures UNIFORM GRINDING. It is only one of the many desirable improvements found exclusively in GIANT KILLER FEED MILLS.

Free for the asking, our new Sweep Mill and Feed Cooker Catalogue, describing large line of plain, duplex and geared grinders for one, two or four horses. We ship from Omaha, Kansas City, St. Louis, Indianapolis, Bloomington, Minneapolis.

Davis Gasoline Engine Works Co., WATERLOO, IOWA.

THE "LESLIE" LINE



OF FODDER AND ENSILAGE SHREDDERS and CUTTERS

is made to meet the demands of those people who want a combined machine that really combines. A shredder that will shred—not chew, bruise and haggle the feed—and a cutter that will cut. The shredder head in the machine and the cutter head lying on the floor are interchangeable, and either or both are supplied as ordered. This is the only true shredder made requiring only low speed. Equipped with any length of straight or angle carrier to order. Remember that this machine covers the whole field of cutting and shredding. Write us for circulars, testimonials, &c.

St. Albans Foundry Co. St. Albans, Vt.

"IMPROVEMENT THE ORDER OF THE AGE."

The United States Cream Separators which have gained such an enviable reputation for their superiority over all competitors, both in exhaustive skimming and perfection of manufacture, are still further improved for

1900 OR THE NEW CENTURY.

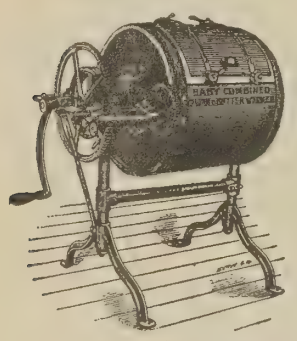
The capacities have been very materially increased. An increase of 20 per cent. was made in 1896 over former capacities. Again increased 20 per cent. in 1898, and are now still further increased 25 per cent. for 1900.

A farther improvement for 1900 is the construction of the internal bowls or cups, which are made corrugated in place of the smooth cups. With the corrugated cups, the flushing of the cream from the separator at the close of a run is accomplished by running skimmed milk through the separator. It is not necessary to use hot water for this purpose unless users prefer to do so.

The accompanying engravings illustrate accurately the corrugated cups above described, Figs. 1, 3 and 5 showing the parts placed one above the other in the order in which they go together.

This construction of the cups overcomes the last criticism that our competitors can make. Competitors have frankly admitted that the United States Separator was decidedly the best skimmer on the market, but have tried, in their efforts to sell their machines, to make a great bugbear of using hot water to flush the bowl.

The new corrugated cups flush perfectly. No cream is left around a central tube, or between a multiplicity of discs, as the United States has neither discs and central tubes, nor central tubes, as is the case in competing separators, which have been trying to get some point against the United States in order that they might find something to check its



VICTORIOUS PROGRESS.

Some competitors have central tubes and discs, and some central tubes only.

The Improved United States Separator took the lead several years ago, and no pains will be spared to keep it in the lead and maintain its reputation of being

The BEST and therefore THE CHEAPEST.

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Outside of the Combination.

A prominent creameryman recently said to a butter solicitor that he did not like to buy of the **Creamery Supplies Trust** but that the **Trust** seemed to be swallowing up all supply houses and creamery specialties, thereby forcing him to buy of the trust whether he wanted to or not.

This is a great mistake; the very best creamery specialties manufactured to-day, **ARE NOT controlled by the Trust** and the creameryman can buy them at satisfactory prices by turning his orders our way. Among other specialties we call attention to is the

Self ... Gauging "All Over" Printer

The printer which delivers a pound brick (or larger if desired) printed on five sides. What is the object of printing butter? Isn't it to advertise your goods? If so, why not put five advertisements on each brick with no more time or expense than is required to print one side of a brick only with old-style printers? The "ALL OVER" Printer is strictly accurate, can be easily adjusted to meet the requirements of varied temperatures, and is much more rapid in its action than other printers.

The "SQUEEZER"
Combined Churn and Butter Worker

is another one of our specialties which leads all other machines of its class. If you will examine the "SQUEEZER" you will ask the question—why didn't the man who invented the combined churn think of the "SQUEEZER" first? It is a model of simplicity and efficiency: absolutely reliable in every particular; can be depended upon to do exhaustive churning at various temperatures and is never out of order. The principal of working the butter insures even distribution of the salt, thereby preventing mottles.

THE SHARPLES CREAM SEPARATORS

in factory or dairy sizes are recognized by the thoughtful, unprejudiced creamerymen of to-day as being the most efficient, economical and profitable separators on the market. The desperate fight now being made on the **Sharples Separators** by the Creamery Supplies Combine is the best evidence in the world that they are not controlled by the Trust. The badly complicated **Trust** must sell its badly complicated separator to be consistent.

We offer you the best line of goods which years of experience and the most skillful workmen are able to produce and we ask for a chance to demonstrate that we are entitled to a liberal share of your business. Protect yourself by consulting us when in need of a creamery or skimming station outfit, or anything in our line of

Cream Separators, Milk Testers, Combined Churns and Butter Workers, Milk Heaters, Milk Vats, Cream Vats, Cream Carriers, Butter Printers, Boilers, Engines, Pumps, Belting, Pulleys, Pipe, Pipe Fittings, Etc., Etc., Etc.

FACTORIES { West Chester, Pa., And Dubuque, Iowa.

Always Up To Date.

Our competitors are rushing into print, seemingly struck by one idea, that of admonishing the public generally that they have produced a "New Century" separator, or a "20th Century" separator and thus incidentally calling attention to the fact of their having marketed out-of-date separators up to the present time.

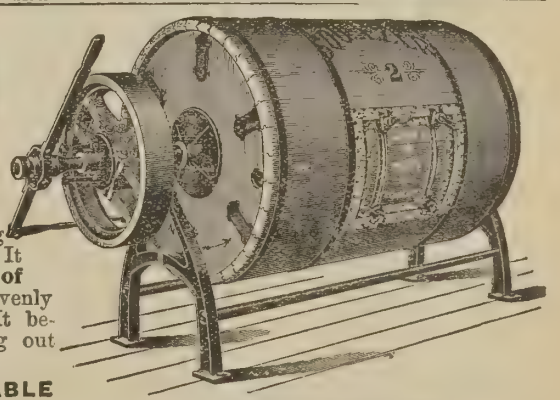
They seem to wake up about "once in a hundred years" from their Rip Van Winkle sleep and realize that the world has been progressing and left them somewhat behind. In order to catch up with Father Time, they loudly proclaim that they have produced something "new and great" as though the breath of the coming century had given them a wonderful insight into the future, and enabled them to contrive something beyond the ken of their fellowmen.

A cursory examination of their separator, however reveals the same old contrivances and complications, simply bedecked anew with a few more frills to cover their weaknesses, but which will not deceive the 20th Century purchaser any more than those of the close of the 19th.

NOT SO WITH

SHARPLES CREAM SEPARATORS.

Their progress is not limited by decades, nor by centuries. They are supplied from time to time with all the latest improvements as occasion requires or necessity demands, and without regard to whether we are "Turning a Century" or not. They are "Kept Up To Date at All Times," and the public is given the benefit of all improvements as soon as demonstrated to be of practical value. Sharples Separators are built to give the purchaser his money's worth to-day, to-morrow, a year, or years hence. Such has been and will continue to be their record. Neither expense nor pains will be spared to keep them in the lead. The passing century has been exceedingly kind to the Sharples Separators, and the coming century welcomes them with increasing popularity. Immense and increasing sales amply attest the fact that the merits of the Sharples make are highly appreciated by the intelligent creamerymen and dairymen of the times.



Sharples Separators ARE ABSOLUTELY SAFE.
Excel in Construction and Finish.
Excel in Simplicity, Durability and Low Cost of Repairs.
Excel in Ease of Operation and Cleaning.

Note and Comment.

Dairy Conditions in New York.—The New Feed Law.—Silage and Condensed Milk.—Special Cream for New York.—Tuberculosis.

ED. HOARD'S DAIRYMAN:—Another safe return to Ohio is ours to note and comment upon the pleasant six weeks past spent in New York, in attendance upon the institutes there, and bear testimony to their usual high standard of excellence and very good attendance. When one looks back ten years and compares the quality of the work now with that then given, and sizes up the audience of today with the occupants of the pews in 1888, the answer to the inquiry: "Are the institutes of any benefit to the country?" would be much as if some one were to ask if a coal oil lamp was the equal of an arc light.

The teachings of the institutes are every where apparent, in changed and changing methods of farming, and the economies of farm life. The audience that attends the meetings now, are conspicuous by their good dress, with every indication of honoring their calling, and seeking its promotion. The papers read, discussions entered into, and the wide range of reading shown, was proof beyond dispute, that farming is rapidly evolving into a profession that is to win its rightful recognition every where. True there are, here and there, darker lines, and shadowy spots, but the spirit of the age is stirring the masses, and it is now a condition that confronts those who will not heed, whether they will reform along demonstrated, best lines, or—well the result will not make good obituary matter.

***

It is not to be gainsayed but that the dairy is again rapidly forging to the front in New York agriculture, and is again to make a struggle for old-time supremacy. It is the live topic at about every institute, and its allied adjuncts, feeds and feeding, were the all important subjects discussed One of the causes that is bringing this about, is the ever increasing demand for milk; for not only the interior cities, but New York and Philadelphia are now taking it by the score of train loads daily, amounting to millions of cans per year, and each day asking for a better, cleaner article, and with advancing prices.

Milk trains start from points more than 300 miles distant from New York, and not a little milk and cream is sold there that starts the day before from along the St. Lawrence. At other points condensaries are being built, stations where milk is taken, graded, sterilized, or modified and bottled, are beginning to have their influence, and here and there a "factory" erected where cream alone is prepared for a most critical class of consumers, to whom 60 cents a quart means nothing if the quality suits. These are some of the influences that are making for betterment in New York dairying, and which was so marked in expression at the institutes

***

Two things were as new (?) as ever, silos, and feed rations for cows. There is a greater disposition than ever to cheapen the cost of the rations, and to do this, the raising more of the proteins and starches than in the past, on the farm, is advocated. "The man with a ration," was in demand at all of the meetings. Mr. Witter with his charts was in great demand. When these New Yorkers can raise 6,000 lbs. of starch on an acre, in the form of silage, it seems poor economy to buy Nebraska starch and ship it 1,500 miles, pay freight, commission and about four men's living between stations upon it, to use as fuel for stock. Despite all of Brother Terry's preaching, and showing just how it can be done, there is an idea prevalent that clover "won't catch," and that it's no use to try to grow peas, oats and the like, but buy gluten and "chop." Others are trying, and between silage and home grown legumes, are cutting down the cost price of the milk, in a marked degree. The old idea that corn could only be grown in the valleys, is found to be a mistake. Corn will grow on the gla-

EASTERN MAID, A. J. C. C., 67892.

Property of STOUGHTON & BURNHAM, Montague, Mass.

ciated hills of New York, if it can have a clover sod to brace up against, and many a wonderful field of mixed oats, peas and barley were reported. From what we heard, we opine that the soils of New York are not so destitute of fertility, as from the lack of decaying vegetable matter, and if the growing of catch crops was more general, and green crops purposely grown to turn under were often used, a state of productiveness would follow that would save New York millions of dollars annually.

***

Under the new law that compels feed dealers to furnish the purchaser with the protein and fat content of the feeds sold, some strange revelations are being made. Oil meal shows a wide variation in protein that is not made good by a difference in price. Cotton seed meal with only a difference of a dollar in price per ton, varied from 29 per cent of protein, to 52 per cent. Several of the high priced protein foods contained less than 9 per cent of protein, and a $25 "chop" contained almost 40 per cent of fiber, with less than 9 per cent of protein, and had a feed value of less than $7 per ton—quite a fair profit.

A certain brand of gluten was about worthless, though the selling price was much above best bran. The starch in some of the "white" feeds was found to be largely of the earth, earthy. A consignment of bran from southwest Kentucky was found to be largely cob dust, and with a suspicion that about all of the "moonshine" had been extracted from if before starting north. The whole feed business of the state now is in the hands of Prof. Jordan of the Geneva Station and it must come in under a guaranty, much the same that obtains in the fertilizer brand and guaranty.

***

Do you remember, Mr. Editor, some eight years ago, of a railroad ride with the writer along a noted valley of southern N. Y? The day was exceedingly cold, snow blowing in blinding whirls at times, and still we saw dairy after dairy, that forenoon, eating hay out upon the snow of those wind swept hills. I said above, that New York was making great strides toward better dairying. I want to make one exception. A few days ago, with a day almost similar to the one mentioned, I went over and around those same hills, and saw by count, twenty of the *same* dairies eating hay on the same *wind* and snow swept hills; and with milk at $1.40 per hundred, these men were demonstrating that dairying in the winter did not pay. It was a pleasure to note that here and there was a snug looking barn with every appearance that the cows were inside of it, bracing up on good care and warmth instead of northwest wind. What's the use, east or west, of talking about the "conformation of a dairy cow" to these fresh air dairymen until they understand and practice "conformation to dairy principles?"

***

There has been a constant fling at the silage men in the east "if your silage is all right, why won't the condensaries take it?" and it has been quite a bananna to crack. Last year the great condensary at Frankfort, N. Y., was built, and here it is a desire of the company that silage should be fed in the winter, as they report that they can make a finer grade of condensed milk from silage fed cows, so fine that they have no difficulty of getting the trade away from the dry feed concerns, up to the point of their supply; and another concern is to be erected at once at another point, and a special bid made for silage made milk for the winter.

Thus one by one the "forts on the hill" of unsupported assertion, go crumbling to dust, for no man of dairy authority in the United States supposed, but knew there was no foundation in the assertion, that silage milk would injure the product of a condensary.

***

The other day I was shown through a great concern where about 20,000 pounds of milk were creamed for a wonderful critical market, one in which a certain amount of cream could be sold f. o. b., at $1.50 per gallon. To get a cream fine enough for this, milk from selected, silage fed dairies was taken, cooled and aerated, then run through separators, pasteurized, cooled and "smoothed," then sealed and shipped. I had never before seen so fine a cream, flavor so perfect and so smooth as was this sample, and so "fine" because it was made from silage made milk, and milked absolutely, as possible to do, clean. Other brands of cream were fine, but none compared with this, and it reminded me of the remark of a creamery operator who said that "knowledge and skill would accomplish any thing in dairy produce, if the patrons would keep the cows' feet out of the milk pails." Still we saw butter made from milk that was far from standard when delivered, but by aeration, running through separators, sterilizing, cooling, using a starter, and churning and salting in an up-to-date way, the butter would score up to a close proximity to the best grades, though in this we do not wish to offer any excuse to the patrons, some of whom would be equally well off if they carried their milk to a fertilizer factory. The amount of skim milk now made into paper glue, is enormous and in that form is only slightly more indigestible than when made into some of the skim cheese seen upon the markets. The by-product of milk at these great creameries seems about solved; about everything from cheese wafers to billiard balls is now made from skim milk, instead of running it into the river, as we once saw them doing by the 30,000 pounds daily at one creamery in New York. If some one will go at it and extract the albumen out of the whey, an article of great value to the arts will be secured, and then if the little fluid which remains can be bottled, and sold for some sort of mineral water, imported or otherwise, there is no reason why a cow cannot rank pretty close up to an oil well in the variety of mixtures and compounds demanded by the human family.

***

The tone of the discussions and the atmosphere of New York over the tuberculosis question, has radically changed in a year, and the old cow has again a reasonable tenure upon life. The great tuberculosis investigation the past summer, under the charge of the Hon. D. P. Witter, at the instance of the legislature, has changed the complexion of the disease greatly, and settled a great many things and shown that some of the most important things known about tuberculosis, were not facts. The mass of testimony was very contradictory. No two men—and the best in the United States were summoned—could agree upon the reason of a rise of temperature when tuberculin was injected. It could not be proven that the disease was transmissible from animal to man, or the reverse.

The incidents to prove this were regarded as wholly wanting in specific detail. In Massachusetts, where the disease is greatest among cattle, shows rapidly diminishing cases of consumption among humans. Dr. Edward Moore and Dr. Smead are challenging doctors and "authorities" to show a single case of transmission, and even the reliability of the tuberculin test, unless accompanied by a most thorough physical examination of the animal by an expert, who is thoroughly versed in animal diseases. It seems to be admitted that the days of general slaughter are over and sanitation substituted.

We predict that a most sweeping law in regard to the sanitation of stables, light, air, ventilation, and like conditions will be enacted by the legislature the coming winter, and the housing of cattle will be made a matter of official inspection. That quarantine and test of cattle coming into the state will be made compulsory, is of great doubt. Just what the committee will recommend to the legislature is a problem, but we here "guess" that the whole matter will be taken out of the jurisdiction of the Board of Health, and made a new duty of the department of agriculture, and the whole question will be considered along conservative lines, and not jeopardize, more than is necessary, the cattle industry of the state. JOHN GOULD.

Ohio.

A Cure for Self-Sucking Cows.

Cows sometimes suffer from the very annoying habit of sucking their own udders. Different courses of treatment are recommended as remedies for this disorder; one of the simplest and most effective, perhaps, is that of boiling a few handfuls of quassia chips in a gallon of water, and washing the cow's teats with the decoction every day for ten days or a fortnight. This decoction is of such an intensely bitter nature that once the cow samples any teats which are dressed with it, she will not be in a hurry to repeat the experiment for some time. The one objection to the plan is that the quassia is liable to taint the milk, except special care is taken to wash the udder, immediately before milking. *Farmers' Gazette* (Ireland.)

PRINCE EDWARD ISLAND COWS AND FEED.

We have before us a couple of inquiries from Prince Edward Island, both claiming that it would bankrupt the average owner of cows in that province if they were to be fed 12 lbs. of grain per day. Feeds are very high there, especially those carrying a large proportion of protein. Wheat bran sells at from $19.00 to $20.00 per ton. Whether one can afford to feed 12 lbs. of grain a day, more or less, will depend very largely upon the character of the cows he has It is our opinion that our Prince Edward Island friends better look at the cow end of the question more closely. Average cows, native cows, cows as good as one's neighbor has are the bane of every dairying community.

One of the important things for these friends to attend to is to get a pencil and some paper and keep an accurate record of the exact amount of milk each one of these cows gives through the entire season. They will be surprised to learn that some of these cows will give at least 100 per cent more milk than others. Let them read that most instructive bulletin from the Kansas Experiment Station, which we published two or three weeks ago. No man could have told definitely, by simply looking at those cows and not keeping a record of what they did, which one would have proved the most valuable, and so we repeat that the thing of primary importance for dairymen everywhere is to bring their dairy business down to a business basis the same as merchants and manufacturers do. Both of our correspondents state that their cows have been giving milk since last spring, and probably they will be fresh again next spring. Under such circumstances, we connot advise very heavy rations. It would be quite a waste of good feed to do so, and they are probably doing as well now under the circumstances as could be expected. Meantime we commend to their consideration the letters of our correspondent from that island and especially the one published on page 904.

Special Premiums for Dairy Herds.

It has always been the claim of the DAIRYMAN that exact knowledge of what the cows are doing is the first requisite of successful dairying.

No man can go into a herd, no matter how wide his experience, and pick out the animals that will give the *most profit for the year*. The only manner in which a proper knowledge of the work of a herd can be obtained, is by systematic weighing and testing of the milk. To encourage this knowledge the Wisconsin Dairymen's Association proposes to offer a series of prizes to the owners of dairy herds, who are willing to take up this work and thus give the dairymen of the state data on which to base a more systematic and profitable feeding of their herds.

The premiums for the past year will be as follows:

The Association appropriates $125, to which HOARD'S DAIRYMAN adds $25, to be awarded in sums of $35, $25, and $15 to the best producing Wisconsin herds in butter and cheese for the year 1899, where the milk or cream has been taken to a creamery or cheese factory. To compete for these prizes herds must have numbered not less than twelve cows, and all the milking cows in the herd at any time during the year or season (and not the average number) must be counted. The yield must be certified by the creamery or cheese factory manager or operator from the books or records of the creamery or factory, and the total number of cows contributing thereto must be proven by the affidavit of the owner or some person having personal knowledge of the facts.

The certificate from the creamery must show the actual amount of milk or cream delivered each month, and the average per cent of fat, or where the cream was tested in a test churn the average test, and in addition the total amount of butter credited. Where the records have been kept in terms of butter fat only the yield of butter may be estimated by adding one-sixth.

The certificate from the cheese factory, in like manner, must show the actual amount of milk delivered each month, and where the test was used, the average per cent of fat, and in all cases the total amount of cheese credited, as determined by the cheese actually made and sold. This will exclude from competition all factories where the "pound for ten system," or other similar vicious methods are used.

For the largest average yield of butter per cow, in herds as above for the twelve months, the prize will be, $35; for the second largest yield, $25; and for the third largest yield, $15.

For the largest average yield of cheese per cow in herds as above for the 6 months, May to October, inclusive, the prize will be $35; for the second largest yield, $25; and for the third largest yield, $15.

Winners of the prizes, as above, will be required to furnish the Secretary of the Association within thirty days after the adjournment of the convention, a detailed statement of the kind of cows composing the herd and the manner of feeding and caring for them, and when such statements are not furnished prizes will be forfeited.

THE *Times*, of Bellingham, Minn., sums up the situation in that vicinity in the following terse paragraph:

"Creamery butter is worth 26 cents per pound, and the creamery at this place is closed down because of a lack of patronage; flax is worth $1.18, and we are not overstocked with it; wheat is worth 50 cents, and we have dead loads of it; corn is valueless, and there is not granary room enough to store it all. Now is the time to cuss the government, and prepare to raise a million cattle, and plant the whole country to flax next year."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein.*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CAREOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

WET STARCH FEED AND BREWERS GRAINS.

In reply to an inquiry from Carlyle, Ills., we do not hesitate to say that the purchase of either wet starch feed or wet brewers grains in car load lots cannot be recommended. These feeds decay very rapidly and, if used at all, should be received fresh at least twice a week in winter and daily in summer. Kiln dried with steam heat they will keep almost indefinitely. As a rule, these dried feeds, although costing more per ton than bran, furnish protein cheaper.

BOOK QUESTIONS.

What book would you recommend to assist in compounding formulas for commercial fertilizers?

What subject does "Newton's Computator" treat of?

Sometime ago I saw a review of a work treating on the possibility of controlling the sex in breeding of cattle. I do not remember the title. Is there any reliable book on the subject?

You have given me several replies already in your paper, for which I am indebted to you as well as for much valuable information contained in your interesting paper.

Baltimore Co., Md. W. F.

Talks on Manures, by Jos. Harris, is a thoroughly practical book. It can be obtained of this office for $1.75 post paid.

Newton's Computator is a set of tables for assisting the calculation of creamery dividends.

The controlling of sex has furnished foundation for much theory and more speculation, but we know of no one who has solved the problem nor of any *reliable* book on the subject.

HOW MUCH CHOP FEED?

State in your paper the amount of chop feed that would be a good daily ration for a milk cow. The feed is mixed in this proportion: 20 bushels of corn, 10 bushels of oats, 500 lbs. bran and 500 lbs. of shorts. The cow has all the hay she will eat.

Manning, Iowa. A SUBSCRIBER.

Very much will depend upon the kind of hay of which this cow has had all she will eat. If it is clover hay, 10 lbs. of the mixture or even 8 lbs. will suffice, but if it is timothy or prairie hay, the cow will need 12 lbs. or more. See table on page 754 for the difference between clover hay and timothy hay.

HOLSTEINS IN TEXAS.

Will you kindly give me the address of a reliable dairy farm in Texas where I might write for information in regard to the purchase of fine Holstein milk cows.

Natchez, Miss. L. I. M

We cannot give our inquirer the information he asks for, but our advertising columns are open to the use of Texas breedsrs of Holsteins.

DELIVERING SEPARATOR CREAM TO FACTORY.

How often do you think farm separator cream should be delivered at the factory so that first-class butter can be made from it? The cream contains from 22 to 26% butter fat, is separated immediately after milking and cooled to 55°F. We paid 25 cents for November butter fat. Our churn gain over test was 16%. A. R. L.

Alum Rock, Pa.

There is not the slightest doubt that the sooner the cream is delivered and under the butter maker's control the better. Every hour cream is kept it is deteriorating in value with a consequent lower quality and price for the butter. Of course there are conditions where it is impossible to have it delivered every day. In such cases the only resource is to keep it as cold as possible till it can be delivered.

FOR A NORTH DAKOTA MILKMAN.

I should like you to formulate a ration from the following feed stuffs: Bran, $11.00; shorts, $12.00; ground corn, $16.00; ground barley, $14.00; oil cake, $24.00; roughage, prairie hay, $6.50; millet, $5.00; corn fodder, $3.00. I have already about 20 tons evergreen sweet fodder corn, very fine in quality, with a few ears; am selling milk to city trade; have thirty head of Jersey grades and pure breds. We have them freshen along at all seasons of year to keep up steady supply.

I wish to follow the advice of the DAIRYMAN, and raise plenty of soiling crops for summer feeds, and would like your opinion as to how some of the following crops would do: Tare, vetch, peas and oats, cow peas and rape, in this climate, and heavy gumbo soil? C. S. H.

Casselton, North Dakota.

We would suggest for a ration, a trial of the following combination, and in the amounts stated:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
10 lbs fodder corn....	7.10	.37	4.04	.12
10 lbs. prairie hay....	8.75	.35	4.18	.14
10 lbs. bran	8.81	1.25	3.86	.30
1 lb. oil meal.....	.91	.29	.33	.07
Totals.....	25.57	2.27	12.41	.63

It should be understood that the above is to be the average for the entire herd, and not the amount to be given indiscriminately to each cow. Fresh cows and large milking cows should have more feed than strippers or those not capable of giving large quantities of milk. It would follow then that some of the cows would receive from ten to perhaps twenty-five per cent more grain than above specified, and others would receive that much less. Millet hay, if not too ripe when cut, may be substituted for the prairie hay. Millet, if cut at just the right time, is probably superior to prairie grass, but the trouble is that more frequently than otherwise, millet is allowed to become too mature before it is made into hay. If the seed is so

far matured that it will shell out in the hand there is not only danger in feeding, but its value has become very much decreased.

We hardly dare venture to suggest soiling crops for the climate of North Dakota, and a "heavy gumbo soil." These are conditions with which we are personally unacquainted, and we do not find in any of the bulletins or works on feeding any reports which we dare use as a guide. In Massachusetts they recommend sowing a combination of vetch and oats, three bushels of oats and fifty pounds of vetch to the acre, April 20th, and the same combination April 30th; and on similar dates, a combination of one and one-half bushels of Canada peas, and one and one-half bushels oats per acre, and one-half acre of each for every ten cows. Then they recommend sowing millet May 10th and May 25th, at the least one peck per acre, and one-third of an acre for each ten cows. Later than this, they plant corn at different dates, sow more millet about the middle of July, and from August 1st to August 10th recommend sowing a combination of barley and peas, one and one-half bushels to each acre, and one acre for ten cows.

Instead of relying upon these different varieties of soiling crops, and being put to the necessity of planting them at different periods, and then going to the field daily to harvest them, it would be much better to build two silos, each of sufficient capacity, one for feeding the herd through the winter, and the other for feeding during the summer, and fill them both with material when at its very best. If this soil and climate will raise corn, we should depend very largely on that, but would not omit clover, and perhaps some of the horse beans and sunflowers as recommended by Professor Robertson some years ago.

A MASSACHUSETTS RATION.

Please give me the most economical and best balanced ration for milch cows from the following feeds: Timothy and oat hay, bran, corn meal, gluten feed and ensilage. I am feeding in the morning, 10 lbs. ensilage, 10 lbs. hay, 4 quarts bran, 1 quart corn meal, and 1 quart mixed feed for each cow; and at night the same, with the exception that one quart gluten feed is substituted for corn meal. If this is not right, why not? And what change would you recommend?

Rutland, Mass. B. N. P.

We estimate that this inquirer is now feeding about 32.41 lbs. of dry matter, containing 2.18 lbs. digestible protein, 16.75 lbs. digestible carbohydrates, 0.80 lbs. digestible fat. That is none too much protein, and the carbohydrates are much in excess of any real necessity.

Just what this mixed feed may be, is entirely uncertain. It may be a valuable feed, or it may be a very poor one, therefore we cannot say whether it should be continued or omitted. We are of the opinion that the hay might be materially reduced, and that we would drop out the corn and increase the gluten feed. Turn to our table on page 754, and note what are the feeding properties of these different constituents of the ration, and then add to or take from as the necessities of the case seem to require.

A NEW JERSEY FEEDING PROBLEM.

We have recently mixed, for cows in milk, the following ration: 1,000 lbs. buckwheat middlings, $19.60; 1,000 lbs. hominy feed, $18; 1,000 lbs. Buffalo gluten, $19; 600 lbs. bran, $18; 500 lbs. corn meal, $18—fed dry, according to size of cow and period of lactation. Cows are doing very well; seem rather thin in flesh. Hay fed is timothy, with trifle of clover and mixed grasses. Will it pay to cut and moisten some of the hay and mix with the grain ration? Will an addition of cotton seed meal or corn meal improve this formula? Can we change this formula and improve it or lessen the cost by substituting other feeds? J. H. N.

Paterson, N. J.

Here is another case where the inquirer might well study the table on page 754. We think that if that table is referred to he will find it prudent to drop out the hominy feed altogether, and because his cows are thin in flesh we would advise his increasing the corn meal. We think a mixture of equal parts by weight buckwheat middlings, gluten feed, bran and corn meal would make an ideal grain ration, and that as an average daily allowance we would feed about 10 lbs. of this and 20 lbs. more or less of the hay, or as much as each cow will eat up clean. If there are conveniences for chaffing some of the hay we would do so and mix with the grain.

PENNSYLVANIA RATIONS.

I have been watching the DAIRYMAN for a balanced ration, but do not find one that fits my case, so will you please formulate one for me in first issue possible. Fodder corn, corn was planted very thick but grew very rank and has quite a little corn on it; cut corn stover, timothy hay, corn and cob meal, $16; ground oats, $21; gluten feed, $16.70; wheat bran, $17; middlings, $18.

My brother would like a formula also. He has the same feeds except that he has well eared silage instead of fodder corn.

Edenburg, Pa. W. A. McC.

We should be disposed to try the following as an average daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
8 lbs. fodder corn....	5.68	.30	3.23	.10
8 lbs. stover.....	4.76	.14	2.59	.06
8 lbs. timothy hay....	6.94	.22	3.47	.11
6 lbs. gluten feed.....	5.53	1.22	2.90	.21
4 lbs. bran.....	3.42	.50	1.54	.12
Totals.....	26.33	2.38	13.73	.60

The only difference we would make where silage was substituted for fodder corn would be to use about 25 lbs. of silage and grain as above specified, and then what stover and timothy hay each cow would eat.

PRESERVATIVES.

Inclosed is a circular of a preparation called preservaline; the circular will tell about it. Also a circular of "Laktone."

Is there anything injurious to health in using this stuff? I shall try the chaffed alfalfa and corn meal in January next. I am feeding ensilage now, and will have my silo empty about the 15th of January, 1900.

La Mirada, Cal. F. M. U.

We have frequently commented on the use of preservatives in food products, especially milk. We are decidedly against their use in any form or manner. In spite of the claims of interested parties, there is a decided danger in using them, especially to children and invalids. There is no necessity for their use, and they only serve to cover up carelessness in handling, and the presence of dirt in dairy products. There is a decided public opinion against their use, and milkmen who use them usually lose more in patrons than they gain in milk saved. We should advise our correspondent to let such compounds severely alone. See pages 278, 378, 834, 977, of Vol. for 1898.

We would be glad if our correspondent would give us his experience with chopped alfalfa.

A MAINE RATION.

Will you please formulate me a ration for twenty Jersey cows of medium size. I sell milk at retail. Bran, $20; gluten meal, (Chicago) $22.50; Buffalo, $18 to $20; cotton seed, $25.50; middlings, $18; oil meal about the same price as cotton seed. I have a limited supply of whole corn ensilage, and about thirty tons of timothy hay. I want to feed as little hay as possible and get good results. I am now feeding to cows, giving a fair mess of milk, 30 pounds silage, 1 pound cotton seed meal, 1 pound gluten meal, 4 pounds bran and all the hay they will eat up clean, which is from 12 to 20 pounds. Want to make my ensilage and hay go as far as possible, but still want as much milk as I can get and of the best quality. F. C. R.

Skowhegan, Me.

The present ration, as we estimate it, contains 21.96 lbs. dry matter, in which there are 1.80 lbs. digestible protein, 10.68 lbs. carbohydrates and .60 lbs. digestible fat. This is really too little for cows that are expected to give reasonable quantities of milk, and if as stated, it is desired to limit the amount of silage and the amount of hay, the increase must come, as in fact it ought to come from the grains fed. We therefore, recommend adding to the grain allowance 3 lbs. Buffalo gluten feed. This will raise the totals to 24.73 lbs. dry matter, containing digestible nutrients as follows: 2.41 lbs. protein, 12.13 lbs carbohydrates, 0.70 lbs. fat.

FLOODING CORN.

I don't see how anyone can keep cows without the DAIRYMAN, or the paper without buying cows. When I started taking the paper, a year ago, I had no cows. Now I have a separator and twenty-one cows. I am getting interested in the silo, and the only thing bothers me is, I am in a country which is subject to overflow from the Skagit river, and water gets from three to four feet deep, and lays three or four days. What effect would that have on ensilage? Might not come for twenty years, and might come next year. O. F.

Burlington, Wash.

It depends on when the overflow takes place, at what period in the growth of the corn. If there was any injury to the growing corn, it would be noticed in the condition of the plants. If the corn was mature enough for the silo, at the time of the overflow, the injury would, probably, be very small as it it could be rapidly cut and siloed, after the water was gone.

A MICHIGAN RATION.

Please give me the most economical and best balanced ration for milch cows, from the following feeds: Bran, $16; meal, $15, and gluten feed, $17; clover and timothy hay, mixed, $7. Have all the corn stover I can use. H. R.

Michigan.

For a minimum allowance we would recommend as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay.....	8.53	.48	3.96	.16
10 lbs. stover.....	5.95	.17	3.24	.07
5 lbs. bran.....	4 41	.63	1.93	.15
5 lbs gluten feed....	4.11	1.02	2.42	.18
Totals.....	23.00	2.30	11.55	.56

A NEW YORK RATION.

Please inform me in your next issue whether I can improve upon the ration I am at present feeding my cows kept for milk especially. I feed 3 qts. malt sprouts, wet, 2 qts. wheat bran, ½ qt. corn meal, 1 qt. oat chops, ½ qt. cotton seed meal to a feeding twice a day, with either light orchard hay or millet in the morning and corn stalks at night.

Oil cake meal, $30.00 per ton; cotton seed meal, $24.00 per ton; oat chop, $15.00 per ton; wheat bran, $18.00 per ton; corn meal, $16.00 per ton; malt sprouts, $14.00 per ton; sugar beets pulp, wet, $3.00 per ton; wheat middlings, $18.00 per ton; ground oats, $24.00 per ton; wet brewers grains, 10 cents per bushel; timothy hay, $10.00 per ton.

Wet and dry starch feed is fed to a great extent, but factory is at present shut down, I would, however, be much obliged to you if you would formulate a ration with starch feed as the principal part. Please inform me if sweet corn, red kaffir corn, teosinte and alfalfa are fit for silage. E. W.

Oswego, N. Y.

It is very difficult to estimate the amount of feed given, when it is stated in quarts, but as far as we can "guess" this inquirer is feeding about 10 lbs. of grain per day, and his entire ration contains not far from 2.3 lbs. digestible protein. This is not far from right, and we see no good reason for suggesting a modification for the present ration.

Starch feed seems to be, according to our reports from different parts of the country, not of very uniform quality, and as it is a feed with which we have had no personal experience, we do not feel competent to offer more than a tentative suggestion. We should at first feed not more than 20 lbs. of the wet feed, and would then increase or decrease the amount as the result seemed to justify, but would include with this feed, whether more or less of it be used, not less than 2 lbs. of bran and 2 lbs. of corn meal.

A MARYLAND RATION

Give me a balanced ration for cream from the following: Bran, $18.00; cob meal, $12.00; cotton seed meal, $25.00; clover hay, $11.00. I am feeding now, 5 lbs. cut corn fodder 5 lbs. cob meal, 5 lbs. bran, 1 lb. cotton seed.

With the above feed that I am now feeding, I give all the clover hay they will eat, twice a day, at least 20 lbs. each, and long corn fodder and wheat straw to run to in barn yard. F. P.

Woodstock, Md.

We would make no difference in the ration whether feeding for cream or milk or butter or cheese. We do not understand how it is possible for these cows to consume so much feed. It seems to us altogether probable that there is a good deal of waste, both in rejecting the feed which is put before them, and in not digesting that which is eaten. We should certainly omit the cotton seed meal for one thing, or reduce the bran and corn and cob meal by not less than 3 or 4 lbs., if, as reported, the cows are eating 20 lbs. of clover hay each twenty-four hours. Of course, if the amount of clover hay is reduced, it may be necessary to hold up fairly well on the grain.

IN THE LAND WHERE FEEDING STUFFS ARE VERY HIGH.

J. D. R. of Metchosin, British Columbia, writes as follows:

"I. In a land where feeding stuffs are very high, do you consider hay and bran and white carrots or mangels a good ration for milking cows? How much of each would you feed per day?

II. Say you have a herd of grade Jerseys, whose milking strain you wish to improve; there is a registered Jersey bull at hand, also a Jersey bull ⅞ pure breed, the offspring of a grade Jersey cow with an excellent record of milk and butter. Would you use the latter bull whose forbears you know, or the former, whose chiefest recommendation is a long pedigree. The grade Jerseys are more deserving of honor than thoroughbred Jerseys in this region."

To the first of the above inquiries we would answer by suggesting that 10 lbs. of bran, 20 lbs. carrots and hay *ad libitum* would make a very fair ration.

The second inquiry is not so easily answered. The rule is never to advise the use of a grade sire; but notwithstanding this rule, unless the registered animal with the long pedigree shows several ancestors, not too far removed, with excellent records, we should be disposed to take our chances with the ⅞ grade with grade cows. Of course we should expect some blanks, but on the other hand there would be reason to expect a fair number of prizes.

A HEIFER'S SECOND YEAR.

R. G. C. says he was disappointed because his heifer with her second calf after continuous milking, does not give as large an amount of milk as with her first calf. In freshening she only gives three quarts a day He asks us to assign a cause and inquires if she will be all right next time. We do not think the continous milking had much to do with the small amount given with the second calf. We are of this opinion because in innumerable instances where there has been continuous milking such results have not followed. It is true, however, that a heifer quite frequently falls off very perceptibly in her yield the second year. She may regain her yield during the present period of lactation, but if not we should expect her to be all right with the third calf.

AN INDIANA RATION WITHOUT HAY.

We have plenty of excellent silage made from corn that we have husked, from 75 to 80 bushels per acre; also plenty of corn stover, some of it either husked or shredded. We have some oat hay, but don't want to us it if we can avoid it.

We have plenty of corn and cob meal, and we buy gluten feed for $15.50 delivered, and

pay $14 a ton for bran. We believe the gluten feed is much cheaper, at the price, than bran, and, hence, think of using as much of it as can properly be used. In buying bran, we can buy coarse bran, or bran that contains the germ of the wheat grain for the same price. What is the analysis of each, and which is preferable?

After giving me your idea as to how we ought to utilize these feeds, make up a ration that you think would be the best suited for my dairy of cows. We are milking nearly one hundred cows, pasteurizing the milk, and selling it in the city.

We have answered some inquiries in your paper heretofore, as to the benefits we get from ensilage. We put up over a million pounds this year, in stave silos. T. E. E.

Fort Wayne, Ind.

Bran, with the germ of the wheat grain in it, is a new specification to us, and we are unable to find any reference to it, but in the nature of things, we should not regard such a feed stuff as superior to coarse, flaky bran, as its proportion of protein would be smaller.

While we agree with T. E. E., that gluten feed at $15.50 is cheaper than bran at $14, it is by no means certain that some bran cannot be profitably used. This is a question that cannot be definitely settled, except by actual trial.

One might try first, something like this:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. stover	5.95	.17	3.24	.07
6 lbs. corn and cob meal	5.34	.38	3.78	.21
6 lbs. gluten feed	5.53	1.22	2.90	.21
Totals	24.74	2.16	14.12	.70

It is quite within the range of possibilities that the substitution of 3 lbs. of bran for 3 lbs. of corn and cob meal, or the addition of 2 lbs. of bran to the grain allowance, would more than justify the extra cost.

AN ONTARIO RATION.

Will you please give me a balanced ration for my cows, 10 in number, all Jerseys. They are not doing as well as they might, 7 of them are fresh in milk or nearly so.

Bran is worth $13 per ton; shorts, $16; corn chop, $16; oat chop, $16; old process oil cake meal, $24; mixed hay (⅔ clover) from $8 to $10 per ton; lots of oat and wheat straw, but hay is scarce; have some sugar beets and turnips.

I am much pleased with the DAIRYMAN and would not like to be without it.

Tavistock, Ont. Wm. H.

It would seem as though an average daily allowance as given in the following formula ought to provide these cows with the necessary raw material for giving a satisfactory return:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. mixed hay	10.25	.66	4.60	.19
8 lbs. oat straw	7.26	.11	3.09	.06
10 lbs. bran	8.81	1.26	3.86	.30
1 lb. oil meal	.91	.29	.33	.07
Totals	27.23	2.32	11.88	.62

Add to the above, the beets and turnips as the amount in stock will seem to justify, feeding both just after milking and never just before or during the time milking is in progress. Also add a limited allowance of salt, say a small teaspoonful with each feed.

A WISCONSIN RATION.

As I see no feeding ration that just fits my case, I will ask you to formulate one for me of following feeds: Corn fodder in bundle, quite heavily eared; corn stover; a limited amount of timothy hay; corn $7, can have it ground with the cob; oats, 23 cents per bushel; bran, $14; oat straw. Would an addition of gluten and oil meal make a better ration. Would it be better to husk corn and shred all corn stover. My cows are mostly grade Jerseys, new milch in September and October. D. W. S.

Elkhorn, Wis.

The crowded condition of our columns and the great increase in the number of inquiries received makes it impossible for us to answer all of them promptly or discuss the different problems as fully as we would like. We are of the opinion that it would be better in this case to husk the corn and shred the stover, especially if the cows reject a considerable part of the coarse stalks. Meantime we suggest to D. W. S. that he make the following formula a basis from which to work, giving some cows more, some less, varying the specific amounts given as the demands of each cow may seem to require and the prices of the different feeds will make it more or less economical to use them:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn fodder	7.10	.37	4.04	.12
6 lbs. stover	3.57	.10	1.94	.04
5 lbs. timothy hay	4.34	.11	1.71	.06
4 lbs. corn and cob meal	3.56	.26	2.52	.04
2 lbs. bran	1.76	.25	.77	.06
2 lbs gluten feed	1.84	.41	.97	.07
2 lbs. oil meal	1.82	.59	.65	.14
Totals	23.99	2.09	12.70	.63

We think the probabilities are that it would be more economical to double the amount of bran and the amount of gluten feed specified, and omit the oil meal under the present prices, but that is a matter which must be left to the judgment of our correspondent.

WISCONSIN QUERIES.

1. Which kind of wheat bran will make the most milk, bran that is coarse and flaky, or bran that is fine and heavy, feeding so many pounds a day each?

2. Does millet seed hurt calves that are, say, two months old, as a calf seldom ever eats anything but the heads? Also is millet hay, cut pretty ripe, good for milk cows?

3. Does ensilage make good food for young calves that are drinking milk, or will they do better without? Which is best for calves, ground oats and wheat bran fed to them dry or will they do better by scalding the two together? J. E. R.

Wisconsin.

I. Coarse, flaky bran is considered much superior to that which is fine and heavy.

II. We should not want to feed calves any millet hay especially if the seed was fairly well matured; neither would we feed millet hay cut pretty ripe to either cows, calves or horses.

III. A little silage will do no harm to calves but there is nothing quite so good for them as nice clean hay. It is the general opinion that it is better to give ground feed to calves, dry.

PREPARED FEEDS.

Inclosed find $1.00 for one year subscription to HOARD'S DAIRYMAN, and sample of feed which I would like to know what is in it. It seems to be crushed corn and oats but whether it contains other feed I do not know. I am buying it from St. Louis and costs me at landing here $16.00 per ton. It is called prepared cow feed. C. M. T.

Zell, Mo.

The sample seems to be a mixture of oat hulls, dust and a small amount of corn. We are very doubtful of the feed being worth the price paid. Unless such prepared feeds are accompanied by a guaranteed analysis from some responsible manufacturer, the dairyman should let them alone and buy only such feeds as have a known composition, and do his own mixing.

BUTTER FROM CREAM SEPARATED AT HOME.

Can a buttermaker make as good butter and run his creamery with as good success where some of the patrons bring the cream that has been separated at home, while others bring the whole milk to be separated at the creamery, as he can, where all bring the whole milk, provided the cream is brought in good condition? What kind of a tester is needed to test the cream, and where can the same be purchased? P. D.

Spencer, S. D.

If the cream is brought to the creamery every day, so that it is received in good condition, there is no reason why the butter made from it should not be of fine quality. Of course if the cream is kept at home for a day, before delivery, the results will not be so good, and if added to the other cream will hurt the quality of that also.

For testing the cream, a Babcock test and a pair of scales are necessary. Write to the dairy supply houses for the apparatus required.

A SOUTH CAROLINA RATION.

In your December 23, 1898 issue, page 910, you formulated a ration for my milch cows; see article, "In the Primer Class."

I now wish to substitute cotton seed meal for the cotton seed in the ration, letting the ration otherwise remain unchanged. How many pounds of cotton seed meal shall I use?

Mayesville, S. C. C.

The formula submitted a year ago was as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. cow pea hay	13.39	1.62	5.79	.16
4 lbs. corn meal	3.56	.32	2.67	.17
3 lbs. bran	2.64	.38	1.16	.09
2 lbs. cotton seed	1.80	.25	.60	.34
Totals	21.39	2.57	10.22	.76

By substituting 1 lb. of cotton seed meal for the 2 lbs. of raw cotton seed, we shall increase the protein somewhat and decrease the fat very materially. This change could be tried, and if not found entirely satisfactory, write again giving the results and stating what other feeds are available.

FREEZING THE TEST SAMPLE.

Can a correct test be made where they take a sample every morning, and the sample is allowed to freeze, and keep it for a month?

Jerome, Mich. SUBSCRIBER.

Freezing has no effect on the testing of the milk, provided the sample is thoroughly mixed when the test is made.

RIPENING CREAM.

Have a separator for farm dairy, find a little difficulty in getting the cream just right for churning; we wish to churn three times a week. Would you please give a few rules or some instructions as to souring cream and getting it to the right temperature; the use of hot water or stove heat, ice or cold water; also when to put starter in and what is best for starter? D. J.

Thornhill, Ontario.

As soon as the cream is separated, put the vessel containing it in cold water and stir the cream gently until it is below 60° F., then remove to a cold place where it will be at a low temperature. When fresh cream is added, stir the contents of the cream jar until both lots are throughly mixed.

The day before churning, remove the cream to a place where the temperature is 68°-70° F. See that it is throughly stirred several times during the day and take care that it is not over warmed on the side next to the source of heat.

The next day it should have a mild clean sour taste and smell, of a fine granular body and considerably thicker than when sweet. When cream is to be heated up for ripening it should be done by setting the vessel in warm (not hot) water not over 115° F., and let the cream come to 70° F. slowly; half an hour is not too long. Never use hot water or place on the stove. If you use ice for cooling, put it outside, in the cooling water, never in the cream itself; it contains too much dirt and may easily taint the butter.

If your butter is of good flavor, use buttermilk for a starter (10-15%), otherwise use some clean whole milk, ripened in the same manner as your cream.

The starter should be of a clean sour smell and taste, and the curd, when broken, should show no gas holes, but be perfectly solid.

Strain the starter through a fine hair seive when adding to the cream and stir till the two are throughly mixed.

A General Purpose Plea.

ED HOARD'S DAIRYMAN:—December 14th, 1899, was a day long to be remembered, for on that day it was my very great privilege to listen to the distinguished and most eloquent orator, who presides as the editor of the DAIRYMAN. His theme, one that we are all interested in, The Dairy Cow, and with what wonderful words and gestures he did expound the doctrine of breeds and feeds that day, with what unction he explained his "washing," as he called it. And as I sat with ears and mouth both open, drinking in the wisdom that flowed so speedily from his fertile brain, tears came to my eyes, as he, with terrible denunciation, attacked, filed left, filed right, and then charged down upon the poor, forlorn "critter," The General-Purpose Cow. As I listened to his silver tongue and heard the words of promise, it seemed to me it must be so for he said it was so.

Coming home that night and sitting in front of the old fireplace, where burned some old special-purpose maple logs, I fell into a sort of trance and my mind ran back for nearly fifty years, and I saw a general-purpose cow owned by Francis Hibbard, who made, upon grass alone, 18 lbs. of butter (by the churn) in one week; and coming down along the years I saw Miss Bell, a thoroughbred Durham, who gave 75 lbs. of milk per day on grass alone, and a daughter of hers who gave 70 lbs. per day. And in my drowsy state I marched up the road and stopped at

"A Good Name At Home

Is a Tower of Strength Abroad." This truth has been perfectly verified by the history of Hood's Sarsaparilla, which effected its first cures in Lowell, Mass., where it is made and where it still has a larger sale than all other blood purifiers. Its fame and cures and sales have spread abroad all over the world, and it is universally recognized as the best blood medicine money can buy.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

The Best Food for Infants

Nature planned that infants should have only milk for at least the first year of life. But thin milk, skimmed milk, will not nourish. It's the milk that is rich in cream, or fat, that does the work. This is because fat is positively necessary for the growing body.

Scott's Emulsion

contains the best fat, in the form of Cod-Liver Oil, for all delicate children.

They thrive greatly under its use. Soon they weigh more, eat more, play better and look better. It's just the right addition to their regular food. The hypophosphites of lime and soda in it are necessary to the growth and formation of bone and teeth.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

Will Bell's, and thinking, as he is the most successful farmer I know, I will ask him what cow in his dairy is the most profitable one, and we went out to the fine dairy barn where fifty sleek cows are stabled and where they have the most intelligent care, and produce more milk than the same number of cows of any patron of the milk station where he delivered his milk. What cow in all your herd is the best? And lo, and behold, she was a mulley, and from her looks could not have been one one-hundredth part Special-Purpose Cow.

Thinks I, perhaps I had better get a little nearer the fountain head of special-purpose, and went down to see the finest dairy in our county. Holsteins, bred from the record breakers of the world on both sides, Guernseys from the great families, and all of them beautiful animals, and having care much better than plenty of farmers' children. Silage and gluten balanced ration fed, (according to Hoard), and I the question ask, which is the best cow you have? and I am shown, not a daughter of Pauline Paul, neither of Elgin Belle, but a cow one-half Durham and her dam just cow, a general-purpose cow.

Coming home, I go out to the barn and look over the mothers there, and stop before an old mother, and a feeling of sadness comes over me, for if I follow the teachings of my distinguished teacher, I must bid her good bye. She looked at me so kindly, I thought perhaps it would be as well to talk with her about it, and I told her about being down to the Dairymen's Convention, and a man there had said she was "no good," and I thought perhaps she would have to go, but believing that no one should be condemned without an oppertunity to be heard in their own behalf, I would let her make her speech. And with such a look as she gave me, full of gentle reproof, she said: "So I have got to go; well, perhaps it is as well, but thank the Lord, I can go for beef instead of bologna, (slightly sarcastic), but before I go I want to say, I have lived with you twelve years last spring; my mother was old Bess, and she was twenty when she died, and you remember at the fair, the year I was born, she took first premium as the best dairy cow, and gave sixty pounds of milk in twenty-four hours, and gave the same amount each twenty-four hours for seven days, and she made that milk herself, and 'twant pumped into her with a bicycle pump either." Say don't get excited. "Well, who wouldn't get excited I'd like to know, when a fellow from Wisconsin gives me such a roast.

When I was twenty months old, a little daughter was given me, and each year since I have come in profit, and you know what I have done. For several years with a lot of those fancy flat land cows, with jaw-breaking names, we did pretty well making cheese, but when you sold the milk to the shipping station it was different. You ought to remember the day you came home and came out here and sat down beside me, and cried; yes, cried because they said you put water in your milk; and that same day a man came along selling that little machine where the bottles go round, and he said he did not believe you ever did such a thing as put water in your milk, and you told him it was pretty tough on an old man who prided himself on furnishing pure clean milk, to have them say such things. He told you if you would keep him over night he would test the milk for you. And that night he put a little milk in the bottles from ten of us, and the bottles went round, and I was there; 4 3-10 per cent he said I stood, and some of those wax figures were only 1 3-10. Say, your eyes were opened, and I heard him say, 'a few such cows will do, but it is only a polite way of watering milk'. What you want he says 'is more like her'; patting me on the back. And you kicked yourself all around the barn, because you had sold my daughters to those special-purpose fellows, and they brought good prices to you. Remember the roan out of the Durham bull brought $60.00, and you never sold one for less than $50.00.

I have only a few words more to say. Start out and ask the best dairy farmers in this dairy county which cows in their dairy are the best for them making milk to sell to the shipping station or butter factory. Ask them if those best cows ever failed to produce a full time living calf, and ask them if they have stood the test of quantity, bottles and all, and I will rest content with their verdict. And another thing, perhaps you better look over the cows that are failures, that die, yes, die producing their young, and abort; whose calves that have cost you one hundred dollars each, go wrong entirely or are only one hundred and fifty pound cows, and see if they are *all* general-purpose cows. And with a look of contempt she wound up by saying. If what he said was true about like producing like, etc., just ask him what is the matter with me. And now I am done, and if you think it is right to let me go, I will stop giving milk. You feed me all the grain I can eat, for six weeks, and I will trade myself off for fifty dollars and you can pay the taxes." HAYSEED.

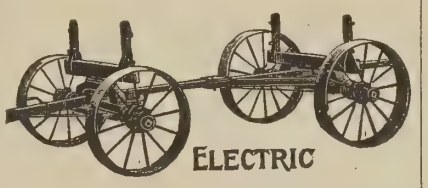
Cortland, Co., N. Y.

A Misapplied Criticism.

ED. HOARD'S DAIRYMAN:--"Milking Scrub Cows" in your issue of this week is all right as showing the difference in individual cows, but it is at the same time a most eloquent sermon against dairying in Kansas. Although the herd was "below the average" they were fed and cared for much above the average and the twelve cows were picked out of thirty, yet the return for all the care and labor bestowed on them, and the making and handling of the butter for a year was $195.00. I should really like to know if there are any men (capable of feeding balanced rations and making good butter) in the "wild and woolly west" who consider that a good business proposition? If there are, send a few east and I will improve their conditions about 500%. L. A. VAN Z.

New City, N. Y.

We fear our New York friend has misapprehended the scope and purpose and lesson of the Kansas Bulletin. The experiment there [illegible] not undertaken for the purpose of finding the largest profit, but to show what would do for even common. [illegible] result shows that among the cows purchased there proved to be a few that were money makers, that others barely paid their way, and a few that were kept at a positive loss. The obvious deduction from this is that every cow keeper ought to know just what each one of his cows is bringing him in and thereby be in a position to discard those that are not satisfactory. If this could be done all over the land the reduction in the number of milking cows would be astonishingly great, and the corresponding profits to the dairymen of the land astonishingly increased.



Our correspondent is mistaken in supposing that the twelve cows reported in the bulletin were selected. There was no picking out. These twelve cows happened to be those which had completed a year's record, and might have been the best, or might have been the poorest, or might have been a fair average of the lot. Since that bulletin was published, twenty-eight of the cows have completed a year's record and the summary of their work was given by Professor Otis at the late meeting of the Kansas Dairymen's Association. Of these twenty-eight cows the five most profitable ones made an average yield of 318.9 lbs. of butter fat which averaged at the regular creamery prices 15¾ cents per pound; the cost of feed was $31.49 per cow, and the net average profit, counting skim milk worth 15 cents per 100 lbs., was $28.29. The record for the least profitable five cows in this lot was an average of 178.8 lbs. butter fat; the cost of feed was $27.40 and the profit was $6.35 per cow. Four of the twenty-eight cows failed to pay for their feed. The average loss on each cow was $2.35.

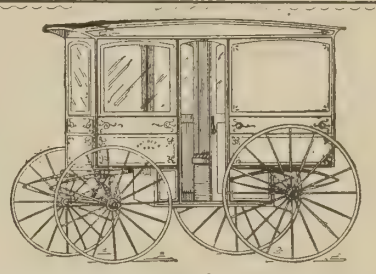
"Contrast these two records." Which kind of cows are you keeping? That is the lesson of those experiments carried on in Kansas as detailed in the bulletin and the subsequent reports of Professor Otis at the Dairymen's Convention.

The trouble with the dairy industry in the land is that we are keeping altogether too many "Cheap John," shoddy, profitless cows. The remedy is to keep a record, know what each cow is doing, and not be deceived and fooled by averages.

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

hounds are made from the best angle steel, which is neater, stronger, and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers



The World Cannot Show Its Equal

MILK FEVER.

According to the Schmidt theory, (the latest,) milk fever is due to ptomaine poisoning in the udder. The excess of albuminoid matter in the colostrum milk and the setting up of albuminoidal fermentation the first three or four days, creates a form of ptomaine poison, causing a sort of creeping paralysis of the nervous system involved, until the spinal cord and the brain is reached and death ensues. If this theory is correct, it would seem that milking a cow right along from one calving period to another without drying off would ensure the constant removal of such fermentative products in the milk, and so prevent milk fever. To secure some testimony bearing on this point, the readers of HOARD'S DAIRYMAN are requested to inform us whether they know of any deaths by milk fever when cows have been milked without drying off from one calving period through another.

A POINTER ON THE IMPORTANCE OF TESTING THE HERD.

An old farmer once said to us: "Why on earth do you keep firing away at us about testing our cows and keeping a record?"

"Well," we replied, "because we see what a lot of money is wasted by you and other men in keeping cows that you know scarcely anything about."

To this he gave a contemptuous snort and said: "What nonsense! Do you suppose a man can live with a cow for two or three years and not have a good judgment as to whether she is a profitable cow or not?"

We replied that we not only supposed but we *knew* that hundreds and thousands of such farmers and such instances existed.

He further asked if we supposed that a man could go into a farmer's barn yard and pick out his best cow and the farmer not know whether she was that kind of a cow or not?

We told him that we thought we could do that very thing in his own herd; that we could pick out cows which he greatly undervalued as to their merit as compared with some other cows in his herd, and could find others which he greatly over-valued.

A year or more after that conversation ensued, a son of this farmer, who had been a Short Course Student at the Wisconsin Agricultural College, concluded to test his father's herd by the scales and the Babcock test. He first took his father's judgment as to which were the best cows. A record of the pounds of milk for six months was kept, together with the test for butter fat once each week.

The test showed that there were six cows in the herd which his father thought were below par, which made from 50 to 120 pounds of butter each more than six of the cows he thought were the very best. The test was a revelation to the father, and he has had nothing to say against testing cows since. This incident shows how valuable it was to this man that he had a good, bright boy who had taken in a little valuable knowledge in this particular. It would be a grand thing if many other farmers would serve themselves in the same way by sending their sons to the Short Course or Dairy School.

In the Bulletin of the United States Department of Agriculture on "The Dairy Herd," Maj. Alvord relates the following:

"A dairyman of wide reputation, president of a state association for years, concluded to adopt the daily milk record rather because of those who advocated it than of any conviction of needing it himself. His herd was of his own breeding, he had handled every cow from its birth, and he and his sons did the milking.

Before beginning the record he made note of the joint opinion of himself and sons—as to the half dozen best cows in the herd, and an estimate of their season's milk yield. When the year's record was completed it was found that in order of actual merit, the cows stood as follows: The best cow was the fifth in the estimate; the second, a cow not on his list; the third was the fourth on the list; the fourth was the first; the fifth was his sixth; the sixth, a cow not in his estimate; and his second and third in previous estimate were way down on the list. These facts were borne out by subsequent records and the man who had called himself a good dairyman, was forced to the conclusion that one-fourth of his cows were being kept at an actual loss while the others barely paid their way."

Dairying in California.—The American Jersey Herd Book.

ED. HOARD'S DAIRYMAN:—I received the paper that I sent you trial subscribtion for; am so well pleased with it that I can't afford to be without it. I am of the same opinion of my neighbor of Los Angeles Co., this is another dairy section and can't be beat in the state; good markets; plenty green feed all the year around. Can raise a fine crop of grain, hay, and a fine corn crop on the same land in a year; alfalfa grows to perfection and a very mild climate; very little cold rain.

I purchased a Jersey bull calf last May (supposed to be a thoroughbred) and when I got the pedigree he was registered in the American Jersey Herd Book. I have never heard of such a book and there are a number of other bulls in my neighborhood from the same man's stock and all are registered in the A. J. C. C. If there is such a book as the American Jersey Herd Book will you kindly inform me, for I wish to correspond with him, who is the secretary of this book and his address. C. W. W.

Lemoore, Cal.

We are unable to supply the information asked. The herd book seems to have dropped out and we cannot find its address or name of officers. Perhaps some of the DAIRYMAN readers can supply us with the address.

An Increased Yield.

ED. HOARD'S DAIRYMAN:—A few weeks ago, you gave me a table for a balanced ration for my herd of Jerseys, and requested me to report the results.

I am highly pleased with the results; am getting two pounds more of milk, per cow, every day than I did before I commenced feeding your ration, and I find the gluten feed much cheaper than bran; it's a splendid feed with other grain.

Your paper has been worth a great deal to me during the past year. The trouble with the majority of dairymen is that they will read your paper, and lay it down with a smile and continue in their old way of doing, thinking that they know just as well as you do, and its hard work to convince them differently. They are too shiftless to try, and too penurious to spend one cent to make five, so afraid they might lose the one cent.

Silver Springs, N. Y. C. E. B.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Board of Trade met on Saturday, this week. The offering of butter aggregated 4,680 pounds. Bidding opened at 27½ cents, but advanced quickly to 28 cents, at which price two lots were sold. Two declined this offer. The sales made were:

Factory.	*Pounds.*	*Price*
Bassett	1,550	2 c.
Malta	1,200	28c.

The sales for the correponding week of the three preceding years were:

Dec. 31 '98, 2,100 pounds of butter sold at 20½c.
Dec. 27, '97, 4,980 pounds of butter sold at 21c.
Dec. 28, '96, 44,460 pounds of butter sold at 20½c.

The Board of Directors re-elected these officers: John Newman, President; G. H. Gurler, Vice president; W. W. Sherwin, Treasurer; L. S. Taylor, Secretary. Inspectors, E. L. McAdams, Chicago; D. C. Woolverton, Belvidere; G. H. Garrison, Greenwood; J. P. Younger, Freeport; John Crawford, DeKalb; E. P. Vail, Marengo; C. H. Potter, D. E. Wood, and T. H. Gibbon, Elgin; Sergeant at Arms, A. M. C. Todson. H. C. B.

Elgin, Ill., Dec. 30, '99.

URIC ACID

Causes More Diseases in the Human System than Any Other Poison.

To Prove what Swamp-Root the Great Kidney Remedy will do for You, Every Reader Of Hoard's Dairyman May Have a Sample Bottle Free by Mail.

Science has demonstrated that in a few days' time you brew enough Uric Acid in your body to produce death.

Your kidneys are your only salvation.

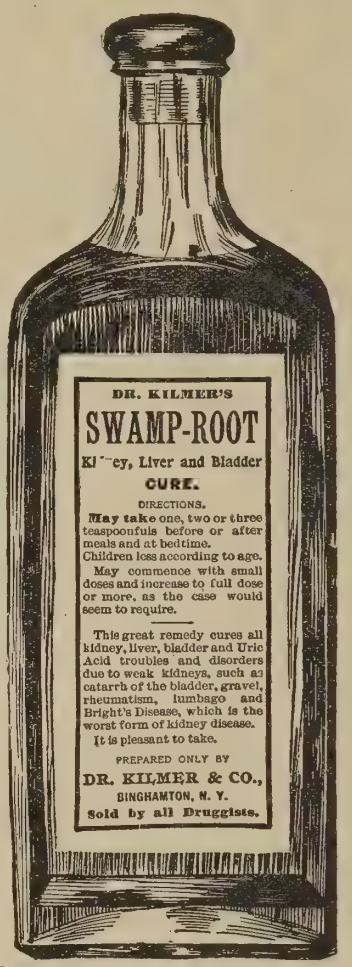
BECAUSE when they are well, they filter out this deadly poison.

So, when your kidneys are sick, you can understand how quickly your entire body is affected, and how every organ seems to fail to do its duty.

They are all being slowly poisoned.

Uric Acid starts in the system more different kinds of trouble and suffering than any other form of poisoning. It irritates the nerves, makes you dizzy, restless, sleepless and irritable. Causes rheumatism and neuralgia, pain or dull ache in the back, joints and muscles; makes your head ache and back ache; causes indigestion, stomach and liver trouble; you get a sallow, yellow complexion; makes you feel as though you had heart trouble; you lack ambition, you get weak and waste away.

The cure for these troubles is Dr. Kilmer's Swamp-Root, the world-famous kidney remedy.



It instantly relieves the congested, overworked kidneys, and gradually brings them back to health. In taking Swamp-Root you afford natural help to nature, for Swamp-Root is the most perfect healer and gentle aid to the kidneys that is known to medical science.

Healthy kidneys keep down the dairy, the cream just rig of uric acid, and you soon churn three times a new health and str

I please give a few rules

Swamp-Root ans- ering upon the least sign of ill health. It will make you well and is for sale the world over in bottles of two sizes and two prices, fifty-cent and one-dollar.

Swamp-Root is used in the leading hospitals; recommended by skillful physicians in their private practice; and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy that science has ever been able to compound.

To prove its wonderful efficacy, send your name and address to Dr. Kilmer & Co., Binghamton, N. Y., mentioning HOARD'S DAIRYMAN, when you will receive, free of all charge, a sample bottle of Swamp-Root and a valuable book, by mail, *prepaid*. This book contains many of the thousands upon thousands of testimonial letters received from men and women cured.

CONCERNING OUR ADVERTISERS.

The successful carrying on of the modern farm requires the utilization to the fullest extent of all its products. In order to make the most of farm possibilities, it is necessary to have modern machinery, not only in the grain field, in the barn, and in the house, but also in the poultry department. Here we find incubators to have become a necessity, and the only question which the farmer now asks, is as to the machine which will do him the most service at the most reasonable price. In this connection we wish to recommend the successful incubators and brooders made by the Des Moines Incubator Co., of Des Moines, Iowa, whose advertisement will be found in another column of this paper. We do not hesitate to recommend them, because they are so simple that any one may use them. They require no expert. The heat regulator is automatic in its action. They have a safety lamp which prevents any danger from fire. The new 1900 catalogue which has just been issued, is a very complete affair in

IF you look at a dozen common lamp-chimneys, and then at Macbeth's "pearl top" or "pearl glass," you will see the differences—all but one—they break from heat; Macbeth's don't; you can't see that.

Common glass is misty, milky, dusty; you can't see through it; Macbeth's is clear.

Tough, clear glass is worth fine work; and a perfect chimney of fine tough glass is worth a hundred such as you hear pop, clash on the least provocation.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

— BANKRUPT SALE OF —

A No. 1 DAIRY FARM

Said farm lies in the Mill Creek Valley, 7 miles from Richland Center, 1 mile from Boaz and a first-class cheese factory. It consists of 479½ acres under fence and seeded down; over 200 acres under plow. Said farm must be sold to close out bankrupt stock. For further particulars address D. G. JAMES, Trustee, Richland Center, Wis.

Honey Pick Up An' Follow Me—New Coon song, snappy music, easy range. Prof. Lewis, noted stage singer, writes from New York: "Got the big hand (encore) first time sung." Murphy & Goodrich, Jersey City. N. J., write: "It is indeed a great song; are using it to good advantage." Geo. Lang, Baltimore, writes: "It is indeed the greatest Coon song of the century." To introduce in new localities, half price—25 cts. Address author, HALBERT L. HOARD, Fort Atkinson, Wis.

all its departments. It describes and illustrates every machine sold by the company and does it so well that the buyer can make his selection with almost the same certainty as though he had the chines before him. It also contains the usual proportion of valuable poultry reading. Send for it. It costs six cents. Address the DES MOINES INCUBATOR CO., Box 424, Des Moines, Iowa.

Henry Stevens & Sons, Lacona, N. Y., write: Sales at Brookside continue good. We have been breeding Holstein-Friesians for 23 years and sales never were better than this fall. Milk, butter and cheese have been bringing a good price, and there appears to be a better feeling among breeders and dairymen than for some years past. The victories our breed have won, in competitive fair ground butter tests, all over the United States and in Canada is demonstrating, year by year, the value of our breed, not only as milk producers but also butter producers as well. Nearly all of the butter factories and most of the cheese factories are now paying for milk by the butter fat it contains, and as far as we can ascertain, our breed are making a favorable showing in this respect, in comparison with other breeds. This together with the competitive tests is exerting, in our judgment, a good influence and stimulating Holstein breeders to breed better animals and to use only such sires whose ancestors give milk rich in butter fat.

One of the most important sales we have made of late was the young bull Brookside Hengerveld Paul to Henry Wisler, of Columbia, Pa. This bull is a son of Netherland Hengereald. It will undoubtedly be remembered by most of your readers that this cow made more butter in her weeks' official test, than any cow ever yet officially tested, viz, 26.66 lbs. Her milk averaged during the week of this test 3.92 per cent butter fat. The sire of Brookside Hengereald Paul is Mutual Friend 3d's Paul, a son of Mutual Friend 3d sired by a son of Pauline Paul. This gives this young bull a combination of blood of the richest and largest producing strains, and he must be of great value at the head of the "Mt. Prospect Herd."

Mr. Wisler's herd contains about 40 head, many of them exceptionally well bred animals. Among the number is a daughter of our great cow Helena Burke. It will be remembered that Helena Burke won the seven day butter test open to all breeds at the Trans-Mississippi Exposition in 1898 after travelling thousands of miles and being exhibited at five state fairs before the test commenced. Her official test is 25.45 lbs. butter in seven days, 98⅞ lbs milk in one day and 654¼ lbs. in seven days, which is the largest week's milk record made by any cow in an official test.

A BIG BUSINESS BOOM.

(A well-known firm says newspaper advertising did it.)

Messrs. Loomis & Nyman, Tiffin, Ohio, for thirty years famous as inventors and manufacturers of well and shaft digging machines, are giving credit to the newspapers for the big rush at their factory. The entire mechanical force is working day and night, and yet the firm is unable to meet the daily inflow of orders There have been great improvements during the past few years in these machines, but Messrs. Loomis & Nyman still lead all competitors, and through the newspapers keep this fact prominently before the public. The firm declare the newspapers made the boom, and that this paper is one of the prosperity makers.

The attention of our readers is invited to the advertisement of the Empire Mfg. Co. Sterling, Ill. Their disk harrow and other farm implements bear a good reputation. Particulars to all who write them.

WHAT IS SPELTZ?

Salzer's catalogue tells all about this wonder, also Million Dollar Potato. If you farm you need it. Largest Vegetable Seed Growers in America. Send this notice and 10c in stamps for 10 Rare Farm Samples and Catalogue to John A. Salzer Seed Co., La Crosse, Wis.

We find upon our table to-day a new catalogue of fruits, plants and vines, also of ornamental trees, plants and vines, issued by Green's Nursery Company, Rochester, N. Y. This catalogue has a fine lithograph cover, embracing many of the rare fruits introduced by this firm. The fruit department embraces nearly 112 illustrations. The ornamental catalogue attached to the other contains 84 new photo engravings, mostly taken by C. A. Green, of ornamental trees, plants and vines, growing upon his own place. Mr. Green makes a special push this season of apple trees, standard and dwarf pear tree, Red Cross currant, Loudon red raspberry, and Champion peach are leading specialties in this beautiful catalogue, sent free to all on application.

KENDALL'S SPAVIN CURE.

The most successful remedy ever discovered as it is certain in its effects and does not blister. Read proof below:

FAIR HAVEN, Conn., Dec. 19, 1898.

DR. B. J KENDALL CO.

GENTLEMEN:—Please send me one of your books, "A Treatise on the Horse." I have used your spavin cure for the past twenty-five years, more or less, and think it the best liniment I ever used for spavin, splint and ringbone; now in my old age I want to learn more about it. You may use my name if you wish.

I once used it on a cow that had been lame in the foot for a long time, and a few applications of Kendall's Spavin Cure completely cured her.

Yours respecttully, R. A. PALMER.

THE PLANTER'S DEPENDENCE ON GOOD SEEDS.

Without good, fresh, fertile seeds, good crops are impossible. It is, then, of the most vital importance that you should exercise the greatest possible caution in selecting the seeds you are to plant the coming season. Since you cannot determine their fertility or freshness by sight, the only certain way to insure yourself against worthless seeds is to buy only those that bear the name of a firm about whose reliability there is no question. There are no better known seedsmen anywhere, and none who have a higher reputation for integrity than D. M. Ferry & Co., of Detroit, Mich. Ferry's Seeds have been a synonym for good seeds for many years. Thousands of gardeners who continue to plant them season after season do so with the full confidence that they will uniformly be found to be of high vitality, and most important of all true to name

Ferry's Seed Annual for 1900 is fully up to the standard of former years, and will be welcomed by all who have learned to regard it as a thoroughly reliable and practical guide to planting. A copy may be attained free by addressing the firm as above.

DAIRY MARKETS.

ELGIN, Dec. 30.—The extreme cold weather prevailing over the Northwest was evidently a factor in the market to-day. Few lots were offered at the opening.

Butter—Bids of 27½c were made and quickly raised to 28c, at which some offerings were sold before the call. Outside markets were reported firm and higher generally, with very light receipts. Bids of 28c on all lots, only one sold.

CHICAGO, Ill., Jan. 1—Butter—Extra creamery, 27c; firsts, 24@25c; seconds, 20@22c; imitation creamries, 18@20c; dairies, choice to fancy, 22c; firsts, 19c; ladles, fine, 18c; roll, 17@18c.

Cheese—Full cream, Twins, good to choice, 11¾@12c; off grades, 8@10c; Young America, 11@12½c; Cheddars, 11¾@12c; Swiss, 12½@13c; Limburger, 10@11c; bricks, 10@11c.

Eggs—Strictly fresh laid, cases returned, 17@18c; city cooler stock, 10@12c; country, 9@ 0c.

Cattle—The market was active at last Friday's average prices. The feeling was strong early in the day, but some late arrivals made a weak finish. Nothing strictly choice was on sale, yet six loads averaging 1,385@1,538 lbs sold at $6.50. Most of the natives sold at $5@6, averaging 1,030@1,523 lbs. Iowa-fed Texas averaging 1,162@1,238 lbs. sold at $4.87½@5.40. Native butcher stock sold actively at strong prices Cows sold largely at $2.90@3.65, and heifers principally at $3.75@4.50. Feeding were strong at $3.50@4.60.

NEW YORK, Dec. 30.—Butter—Extra western creamery, 28c; extra Junes, 26c; ladles, 17@20c. Market firm. Receipts, 3,200.

Eggs—Fresh eggs, 23c; refrigerators, 12@14c. Receipts, 5,000. Weather very cold.

BOSTON, Mass., Dec. 30.—Butter very firm, 28c.

Eggs—Fresh eggs, 24c; best April, 14@15c.

Cheese—Steady.

WASHINGTON, D. C Dec. 30.—Butter—Market firm. Extras, 28c; fine firsts, 26@27c; fancy Junes, 25c; choice imitations, 21c.

PHILADELPHIA, Pa., Dec. 30.—Butter—Market firm; creamery, 28½c; prints, 30c.

KANSAS CITY, Dec. 30,—Butter—Extra weak, 24c. Big accumulations and dairies being substituted.

NEWARK, N. J., Dec. 30.—Butter—Market firm. Extra Elgins, 28c. Receipts moderate.

NEW ORLEANS, La., Dec. 30.—Butter—Creamery, 27c; dairies and ladles, 17@20c.

Eggs—Storage eggs, 12@13c.

Cheese—Unchanged.

NEW YORK MARKET.

NEW YORK, December 30—Butter—Receipts for the week, 23,157 packages. Exports for the week, 50 packages.

The year is closing with as light stock of butter in this market as was ever known at this season; fresh makes of all kinds ars coming very sparingly, refrigerator goods are about used up and everything points to a scarcity of good table butter and continued high prices through the winter. Extra fresh Western creameries were marked up to 28c on Friday and sold quickly at this price, and at the close there is not enough of this style butter arriving to supply the demand. Fresh imitations sold at 23@25c, and high grades of Ladle butter found plenty of buyers at 21@22c. Best June Creameries were in good demand at 25 to 26c, and under grades were enquired for at 23@24c. We quote:

Creameries, extra, 28c; medium, 26@27c; poor, 24@25c. Dairies, extra, 26@27c; medium, 22@24c; poor, 20@21c. Ladles, extra, 21@22c; medium, 19@20c; poor, 16@18c.

Cheese—Receipts for the week, 15,330 boxes. Exports for the week, 10,175 boxes. The comparatively small amount of finest cheese now in stock leads to a very confident feeling among holders. There was very light trading in full cream cheeee this week, not enough to call it business. Exporters took some skims and were able to buy them at fully one cent pound less than last week. We quote:

Full Cream, large, extra, 12¾@13c; medium, 11½@ 2½c; poor, 10½@11c. Full cream, large, extra, 11½@12¾c; medium, 11¾@12c; poor, 10½@11c. Part Skimmed, extra, 10@11c; medium, 8½@9¼c; poor, 4@6c. Skimmed Cheese, poor, 4@8c.

Eggs—Receipts for the week, 35,356 cases.

There is trade enough to take all the strictly fresh eggs arriving and at full prices. For all other grades the trade is demorilized and prices are decidedly lower and irregular. We quote:

New York & Penn. strictly fresh, per dozen, 24@25c; Western & Northern, strictly fresh, per dozen, 23 24c; other grades, fresh, per dozen, 15@20c; refrigerator stock, per dozen, 8@14c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Dec., 28—Butter—The shrinkage in the available supply of butter is still as pronounced as ever, receipts for the past week even falling below the limited expectations of receivers. This condition applies to the whole range of grades and kinds, from the finest table stock to baking butter. Prices would have to be marked up still further were it not for the fact that they have been advanced already to the danger line, and there is a prevalent feeling of hostility to any material increase in values. The quality of the winter make of creamery has so far given general satisfaction, as there is perhaps less than the usual proportion of goods showing wintry flavor. Choice fresh creamery of the gathered cream variety continues to be the subject of frequent inquiry, and much wonder is expressed as to its whereabouts We could safely promise an advance on our quotations for some of the favorite marks of this grade if that would be an inducement to shippers to let them come this way. Imitation creamery and fine ladles extremely scarce. A few lots of good ladles have made their appearance and have sold well up to, if not above their value. The holdings of storage stock have been still further reduced, and it is supposed that no desirable lots remain unsold. Roll butter, on flattering promises of receivers, has shown some increase, but the demand has been fully equal to the enlargement, and buyers are still eager for more. Storepacked very scarce and quickly salable. Baking stock still inquired for.

Creamery Separator, extras, 28c; firsts, 26@27c; seconds, 24@25c. Creamery Gathered Cream, extras, 25@26c; firsts, 23@24c; seconds, 21@22c. Creamery Ohio, extras 25@26c; firsts, 23@24c; seconds, 21@22. Creamery Imitation, firsts, 9@20c; seconds, 17@18c. Iowa & N. W. Ladle, firsts, 19c; seconds, 16c. Ohio & Indiana Ladle, firsts. 18@19c; seconds, 16c Ohio Rolls extras, 19@ c; firsts, 18c; seconds, 16@17c. W. Va. Rolls, extras, 18c: firsts, 17c; seconds, 16c. Ohio & W. Va. Storep'd, extras, 17c; firsts 16c; seconds, 15c. Creamery Blocks (2lbs), extras, 28c; firsts, 27c; seconds, 25@.6c. Creamery Prints (1½lb), extras. 29c; firsts. 28c; seconds, 25@26. Md., Va. & Penna. Prints, extras, 24@25c; firsts, 21@23c; seconds, 20@21.

Cheese—Receipts light, demand good; market firm as quoted.

N. Y. State—Cheddars, fine, 12¾@13c; choice. 12¼@12½c; fair, 11½@11¾c. Flats, fine, 13c; choice, 12½@12¾c; fair, 12¼@12½c. Small, fine, 13¼@13½c; choice, 13c; fair, 1 ½. Ohio—Flats, fine 12½@12¾c; choice, 12¼@12¼c; fair, 11½@12c. Ohio Picnic, fine, 13@13¼; choice, 12½@12¾c; fai , 11½@12¼c. Skims, fine, 10@10½, choice, 9@9½c fair, 8¼@8½c. Swiss Cheese, fine, 12@12½c; choice, 11½@1 ¾c: fair. 10½@11.

Eggs—With continued fairly liberal receipts, we are forced to admit that there is little or no activity just for the time being, but after a few days, when things will have resumed their former conditions, we look for a better demand; there is a fair demand, and our market rules about steady at 19c.

LIVERPOOL, Dec. 30.—Butter—Finest United States, 95s; good, 75s.

Cheese—American finest white, 57s; American finest colored, 59s.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line

For Sale—A few extra good grade Jersey heifers at a bargain. Sired by Ophis Exile, a 75% son of Exile of St. Lambert. Address, B. C. SETTLES, Palmyra, Missouri.

For Rent for a term of years, the Arlington, a private dairy supplying creamery butter to a private trade? Ice-cream plant in connection Good demand at cash. Plant consists 25 cows, dairy house, separator, churn, gasoline engine, ice house, refrigerator, 3 barns, 3 dwellings, with peach and apple orchards In every way an excellent farm and business. Have been a long while in business and feel disposed to share profits with a capable and good manager. Address, L. SCOTT, Bangor, Mich.

General Purpose Methods.—Barn Building.

ED. HOARD'S DAIRYMAN:—I have just been reading with a degree of surprise that borders on astonishment, the report of Mr. Kinsley's on the 20 Iowa dairies. What a government bulletin that would make, and how I would like to see every person in this country who owns a cow, obliged to post it so that he would have to see it every day till he had driven out all the 81-pound methods he has been guilty of and put in their place the 325-pound methods. It is right here, more than at any other point, that the difficulty lies—the getting hold of the man who needs to be reached.

A few days ago, during the progress of the first snow storm, I visited a farmer who lives on the outskirts of a large city and who has a good and quite large farm with house and barns, within fairly a stone's throw of a railway station, all situated apparently as favorably as possible for a fine dairy, with quick market and access to cheap feeds. So I looked about for the herd and I found it—a few cows of the most doubtful sort and every one of them out in the open field, apparently driven away from the lee side of the stack in the barn yard by a lot of young horses that had taken possession of the situation.

The cows were mostly quite thin, and as the searching wind went by it seemed to go right through them and come out on the other side not much disturbed by the encounter. Of course I did not find any agricultural literature in the house, though the family is exceedingly bright in all general ways and all are eager to get on. What does it all mean? Is there no way of jogging the old farmer out of the ways of his fathers?

In this case there was a low ridge north and west of the barn on which a double row of evergreens would have made the open yard, a splendid shelter if out-door feeding was necessary. Still I have no recollection of any use of trees or shrubbery on any farm as a wind break, except on the farm where I spent my boyhood, where the original forest was spared to excellent purpose. Of course I do not pretend that trees are never planted for this purpose, but they are planted so rarely that one would have to go a long way to find anything of the sort in use.

Happening to stop at Cornell University on my trip I was much pleased to find that the lack of knowledge of the requirements of stock and coarse feeds in winter has brought to the surface a new branch of the agricultural department, that of forming and reducing to paper designs for barns and stables. A head for this department could not be found, so he was improvised from a student in the department, and he is proceeding to put the students of the course through the mazes of barn planning, which are all scanned and criticised as they come from the hand of the student, who must work entirely from ideas of his own; for where is there any information to be had on the subject?

Our barns have always been square boxes with roofs on them and with stables in them, usually on one corner, and as often as not on the coldest corner at that, if, indeed, they were not made a separate structure, so that the weather could attack them from all sides. What chance was there for economy of any sort of heat waste, feed handling, watering or the saving of the manure? It was the general idea that a cow was practically valueless through the winter and to keep her as cheaply as possible was the consequent notion. We read of the winter dairies that give milk in large quantities these days and we are in danger of supposing that a general reform in this regard has taken place, but such is far from being the case.

I was rather pleased to find that the Cornell barn expert is not undertaking to impart to his students the fine qualities of the round barn. He is decidedly against these barns and says that they are in no way as economical as the square one. A model of the plank framed barn was, on the other hand, produced as an improvement of the old heavy frame, as it is held to be stronger, with half the timber in it that timber frames require. As to ventilation I heard some remarks to the effect that the King system was good, but a much simpler one was not out of the question.

JOHN CHAMBERLIN.

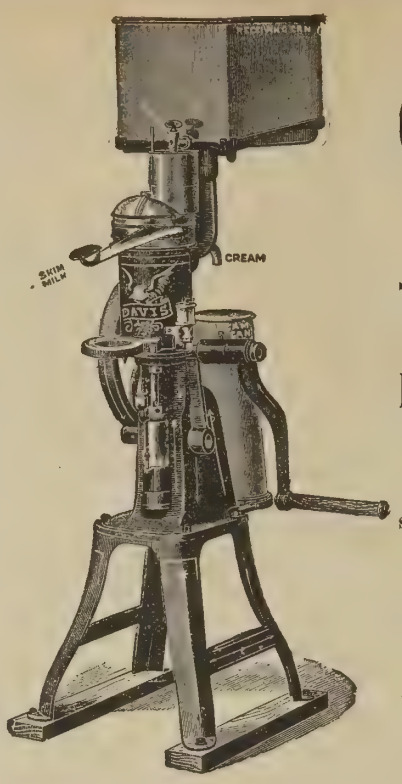
Food Poisoning in England.



The *New York Tribune* comments in a very significant manner, editorially, on the revelations made before a departmental committee of inquiry at Westminster, England, not long since.

The medical officer of health, who is also municipal analyst of the city of Birmingham, was among the witnesses. He testified that he had examined 1,537 samples of milk, and had found in 135 of them either boric acid or formaldehyde. In 871 samples of butter, 243 contained boric acid. In 120 samples of oleomargarine, 101 contained boric acid. In twenty-one samples of meat food, such as bacon, ham, sausage, etc thirteen contained the same drug, at the rate of from ten to forty-five grains in the pound. In sixty samples of cream, jam, vinegar, etc., twenty contained either boric or salicylic acid. The proportions of food thus poisoned were: Milk, 9%; butter, 28%; cream, etc., 33%; meats, 64%, and oleomargarine, 84%. (The one thing made as an imitation and used as a fraud was thus the worst of all; a suggestive fact.) The general proportion of poisoned food in all classes was 20%. That, it must be said, was not a creditable showing. It does not well entitle the producers and tradesmen of the Birmingham district to protest against the unwholesomeness of American food products.

We have used the word "poisoned" advisedly. Of course, the men who put these drugs into food do so for the purpose of preserving the food, and they insist that the drugs are harmless. The Birmingham health officer had strong convictions on that subject. He tried some of the drugged milk, not upon himself, but upon kittens. And the kittens wasted away, and in a few weeks died. Perhaps human babies will thrive on what will kill kittens, but he did not think so. On the contrary, he gave it as his expert opinion that boric acid, taken into the human stomach in the quantities found in the foods examined, would produce marked constitutional effects, sometimes of a very severe character, and sometimes actually fatal; and he attributed the prevalence of various grave enteric disorders largely to this poisoning of food. In that opinion there is every reason to believe he was right. The man who puts boric or salicylic acid or any such stuff into food for the sake of "preserving" it does not merely preserve it. He poisons it, and poisons those who eat it.

The authority quoted found in all his researches 520 samples of poisoned food. In consequence, only twelve men were prosecuted. That seems a small number, unless each of them was responsible for many of the samples. However, it is encouraging to note that of the twelve who were prosecuted ten were convicted. It is commendable, too, that the opinion was expressed that the use of any such "preservatives" should be prohibited by law. This is the only safe policy, for New York as well as for Birmingham.

It is instructive to note that the fraud oleomargarine was poisoned 84%. How well this bears out our contention that there is no protection whatever at the hands of men who are dishonest enough to make a counterfeit.

NEW 20th CENTURY

De LAVAL "ALPHA" Cream Separators

In wishing the Creamery and Dairy interests of the country and every one in any way associated with such interests a Happy and Prosperous New Year, the De Laval Company avails of the opportunity to briefly announce the further expansion and improvement of its machines in conjunction with the opening of the new year.

The word De Laval has always been synonymous with progressive development. Every year has marked some new improvement or step of advancement bringing the "Alpha" De Laval machines still nearer to literal perfection. 1900 is to be no exception, bringing with it the general adoption to the "Alpha" disc system of the new Split Wing Tubular Shaft invention, thus effecting more even and thorough distribution of the milk in the separating bowl than heretofore accomplished. This improvement effects generally every feature of separator practicability, affording considerably greater capacity with still more exhaustive thoroughness of separation—particularly under the harder conditions of heavy cream and low temperature, while the accompanying change in bowl construction obviates all previous possibilities of clogging.

Hand in hand with this expansion and greater utilization of the "Alpha" disc system of separation various mechanical improvements and touches of betterment have been put into practice during the past few months, including a new method of bowl locking and unlocking, which precludes the springing of bowl spindles and the throwing of bowls out of balance from careless or impractical handling in such connection, and new oiling arrangements which effect a material saving of oil heretofore wasted and render literally impossible the heating or setting of machines and the splattering of oil around them.

Everything that twenty years of experience in both Europe and America has yet been able to devise or suggest has now been done toward making the 20th CENTURY "ALPHA" DE LAVAL SEPARATORS perfect for their purpose, and great as has been the universally conceded superiority of the De Laval machines heretofore the new standard is now raised still higher.

The new improvements apply to all styles and sizes of machines, both Dairy and Creamery, Hand and Power. The following week the new capacities will be announced, prices remaining the same as heretofore.

The Verdict of the Cows.

Our readers have taken a very decided interest in the comparative merits of the two cows, My Lady Baltimore and Countess of Level Green, published on page 827. That they are both exceedingly fine exponents of the dairy form goes without saying, and it is evident that the selection of either as the superior animal can have but small foundation on which to base a preference. This has been the experience at fairs, when sometimes one animal, and sometimes the other has taken the first prize. Countess of Level Green took first at Indiana and second at Ohio; My Lady Baltimore first at Ohio and second at Indiana. The owner is, evidently, the best judge on this point, as the following letter shows.

ED. HOARD'S DAIRYMAN:—I desire to state that the appearance of the portraits of two of my cows, the "Countess of Level Green" and "My Lady Baltimore," in a recent issue of your paper, has been a matter of great gratification to me.

And, as the owner of the cows, I have taken an unusual amount of interest in the discussion which you so generously invited, and which has been taken up with so many words of praise, and well defined expressions of opinion.

It may be of interest, to those taking part in the discussion at least, to have the owner's opinion of the cows. Countess of Level Green, under exactly similar conditions as to period of lactation, gives a larger flow of milk, and is a more presistent milker than My Lady Baltimore, but is not quite as rich in butter fat. But as near as I can estimate, My Lady Baltimore is the more enconomical producer of butter, consuming less value in feed for a given value of butter fat; and put on same rations, not exceeding what My Lady Baltimore will handle safely, she will exceed Countess in production of butter, for a year—though fed without reference to amount of feed consumed, and each cow worked to her full capacity, I think Countess will turn out about 10% more butter fat in a year at about 10% more cost on the whole amount produced.

From a breeder's point of view I prefer My Lady Baltimore, as she has more of the qualifications that I am desirous of reproducing, and I believe her, also, to be the more prepotent of the two animals.

I have never tested these two cows for a year, nor a week, but from daily tests taken from time to time, I think either one of them would make above 18 pounds of butter for their best week, and in excess of 500 pounds of butter in a year.

The portraits shown are exact reproduction of photographs, and have not been altered or fixed in any way, as are many of the cuts in representation of noted animals, which appear in farm journals, but the pictures give a wrong impression as to the general conformation of the two cows. Contrary to the general impression given, as evinced by comments published, My Lady Baltimore is the smoother and nearer round, and is broader on the back and withers than the Countess.

Neither of them have any tendency to kick over the milk pail as found by one writer. I have never found any of that disposition among Guernseys. They are of a very tractable disposition as a breed.

Perry, Ohio. L. V. AXTEL.

JUDGEMENT RENDERED.

I would say in reference to the two cows in December 1st., that Lady B——, is my choice. She has a better sack, longer in the flanks, broad hip, good backbone, teats wider apart, longer veins, lighter in front, less pendulum, broader between the eyes and longer from her nose to her eyes.

Some friend sends me the DAIRYMAN and I get good information out of it. I patronize the creamery. We Georgians down here don't know much about cows. J. W. H.

Chipley, Ga.

I consider Countess of Level Green, A. G. C. C. 4198 the better cow.

1st Third— Countess has better double wedge shape, broader poll, eyes more limpid, clear and placid, showing a more gentle and kindly disposition and nervous temperment, dish faced, head and neck more feminine, sharper withers, and deeper chest than My Lady. If there is any point I dislike it is surely a Roman nose (as my Lady) and her eyes show a disposition a "cow puncher" would call "snakey".

2nd Third—Countess is deeper in lower front of chest, giving more heart and lung room, having shorter front legs, also better back, navel more prominent, ribs sprung more but not as deep as My Lady.

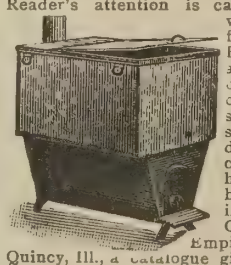
Last Third—Thinner thigh, flank arched higher, and more symmetrical udder and teats. R. F.

Maricopa Co., Arizona.

I shall have my shy at Countess of Level Green and My Lady Baltimore; the latter I think (with one exception, possibly two) the better cow. I like her for her spareness, for her double-wedge shape, her incurving thighs, high pelvic arch, and for her nervous organization, as shown by her eye; (am afraid she is a kicker; and I do not like her straight face). I think she has the better udder development, also navel, and to take her all around, think her the better cow. But they are both stunners. H. C. W.

Garnett, Kansas.

I believe Countess of Level Green excels in heart and lungs, and has the best nervous system, as evidenced by her full, large, wide-awake eyes, and high, prominent backbone. Notwithstanding this, I believe My Lady Baltimore to be the superior cow, unless Countess of Level Green's nervous force over-balances the many points in favor of My Lady Baltimore. She has the stronger jaw, the greater capacity; excelling in length and depth of body, and notwithstanding she is the younger cow (judging from her register number) she has less tendency to lay on flesh; she trims down better; her ribs are sprung more, and set further apart; her pelvic arch excels in height and curve. She has better hip bones; her body is broader, and more angular in shape; she seems to be finer boned, and hence can produce butter at a less cost; she has better milk veins, and a better shaped udder, and her udder does not appear to be as beefy as that of the Countess. Unless the superior nervous energy and vitality of the Countess overcomes the many points in favor of My Lady Baltimore, I believe the latter to be the superior cow. However, I believe that nervous force and vitality are great factors in the dairy cow, that are not fully appreciated.



Minneapolis, Minn. C. L. S.

Digestion Co-Efficients.

ED. HOARD'S DAIRYMAN:—In view of the law recently in force in this state, requiring an analysis of dairy foods, the question of the amounts of digestible nutrients contained in the various foods, as compared with the total nutrients as given by the analysis, seems important in forming a ration, especially if the ratio between the digestible and total nutrients varies materially in the different foods when properly fed—as for instance, if 95% of the total protein of bran and only 80% of the total protein in gluten were available. I am led to this question from the fact that "Diamond gluten feed" is claimed by the manufacturers to contain 27 33-100 per cent protein, where-

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

Jersey Bulls AND HEIFERS out of large milking and tested dams, FOR SALE. W. R. THOMAS, Bellmore, Ind.

FOR SALE—For a short time we are offering A. J. C. C. **Jersey Bulls** from two to fourteen months old at **reduced prices.** They are from choice cows and are sired by St. Lambert of Brodhead 46957, one of the best of bulls, as his pedigree will show. We also have a few cows and heifers for sale. Write for catalogue.

CHARTER OAK HERD. J. P. BRADBURY, Pomeroy, Ohio

as Bulletin 154, Cornell Station, gives the digestible protein in gluten feed as 19 2-5 per cent. The foods most used here are corn meal, bran, gluten feed, linseed meal and gluten meal. H. H. H.

Gouverneur, N. Y.

The following table gives the percentage of digestibility of some of the more common feeding stuffs. For the benefit of our readers we will say that such a table is not a hard and fast rule to be followed regardless of kind or condition of the fodders used. The man who allows his timothy to become over ripe before it is cut must not expect to find that 56% of its protein will be digested by his cows nor that the carbohydrates are of equal value as in the hay cut at the proper time. The same is true of all grasses and fodders. Maturity means loss of feeding values in the stalk but increased value in the grain or seed. In a like manner, spoilt, moldy, musty, or rain washed fodder of any kind is accompainied by a loss in the per cent of nutrients that can be used by the animal.

Over heating in the stack or mow will also cause lower feeding values, especially where the degree of heat is such as to darken or brown the color. Such change in color means that part of the digestible value of the fodder has been driven off and the remainder so changed in composition that its value is decidedly decreased.

Both quality and quantity have an effect on the amount digested, quality having the greater influence. Thus the protein in coarse fodders varies in digestibility, from 35 to 80%. In the younger plants there is less woody matter (crude fiber) to enclose and lock up the protein, consequently the juices of the stomach can dissolve a larger amount. As the fodder becomes older the digestibility decreases till in wheat straw but 11% of the protein is in a condition to be used.

The amount of the nutrient present also influences the digestibility. It will be noted by comparing this table with that on page 754, that as the per cent of a nutrient increases in fodders its digestibility increases as well. Thus the feeds high in protein have an equally high digestibility and in cases where the protein content has been increased, as in the case of artificial concentrates like gluten meal, the per cent of digestible protein should increase along with the actual increase:

PER CENT OF DIGESTIBILITY OF NUTRIENTS.

FEED STUFFS.	Protein %.	Carbohydrates %.	Crude Fat %.
Kafir corn	79	76	90
Buckwheat middlings	76	79	76
Corn and cob meal	5[illegible]	28	84

Quite a Distance into the Dairy Business and Feed Scarce.

ED. HOARD'S DAIRYMAN:—I want you to continue sending the DAIRYMAN and all the back numbers, as I am quite a distance into the dairy business, and want all the assistance possible. Feed is very scarce in this section, or is held very close for fear of being short before grass will be ready for pasture. We had a terrible drouth here last summer and in consequence grain did not turn out very well.

I want to feed to the best advantage of the following: Corn chop, $16; shorts, $18; bran. $15; ground oil cake, $33; barley, 42 cents per bushel; peas, 65 cents (very scarce); oats, 30 cents per bushel; wheat, 64 cents per bushel. I have a silo 11×14, 30 feet high, about one-half full of very well eared corn, oat straw very limited amount, wheat straw short also, and a stock of 40 head cattle, mostly Jerseys. W. W. S.

Pennsylvania.

It is by no means an easy matter to prescribe a formula for a ration under the conditions set forth above, and it requires more courage than most of us possess to meet such emergencies as they ought to be met. These cows must be wintered whether they give milk or not. It will cost a good deal of feed to do this and there is no immediate return for it. If we add 25 per cent or 50 per cent to this necessary feed for maintenance and receive a product in return which will somewhat more that pay for this extra feed there will be some profit in the transaction. The amount of this profit will depend upon our liberality in feeding and the dairy capacity of the cows. We estimate our friend has silage enough to allow him to feed approximately 20 lbs. per day to each cow and it is quite certain that none of the other feeds named are as cheap or as profitable for him to use as corn and bran. Oats at 30 cents per bushel are practically the same as $20 per ton, and at most are worth not to exceed 10 per cent more than bran and frequently not so much as bran. If we were situated just as he is we would mix bran and corn chop in equal parts by weight and then feed each cow according to the return she would make, possibly some of them as much as 10 or even 12 lbs. and others only enough barely to keep them in thrifty conditon.

We are aware that this is not very explicit advice, but the conditions are such that unless one is on the ground where he can make personal observations from day to day, and week to week, explicit advice would be more misleading than the general suggestions we offer above.

Improving the Dairymen.

ED. HOARD'S DAIRYMAN:—I wish to express my strong and high appreciation of all your efforts to improve the dairyman and get him to follow new and better methods, for there is a great deal of filth about the milk and butter business. Especially do I commend ways to get a dietetic cheese, both for home and foreign consumption; nothing but whole cream, and factories provide themselves with means to ripen it. Then a higher grade of butter. And there ought certainly to be passed some clear and strict and plain law regulating oleomargarine. Farmers' interests deserve more recognition in Congress.

Canada shames us in cheese and butter exports.

There are other important missionary works you are doing. Don't let up! How can you increase your subscription? The only way is to enlighten the slow and dull farmers. H. B. HOWELL.

Orleans Co., N. Y.

A Good Foundation.

ED. HOARD'S DAIRYMAN:—I am enjoying your paper, which I took for the short time on the quarter test, very much indeed.

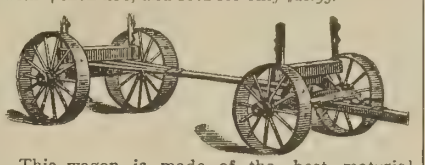
I have a small dairy, among them a few Holstein cows. I had a record of five of them kept this summer:

One gave 1,813 lbs. of milk; one 1,350; one 1,304; one 1,273 and one 1,272 in thirty-one consecutive days, running in the pasture without extra feed. Milk tests between four and five per cent.

As I am trying to get up a good herd, would like to know if this is a good average.

I notice that you show in your paper Jerseys, Guernseys and Holsteins.

Which would you advise me to put in to form my dairy? J. S. F.



Chicago, Ill.

You would be perfectly safe in selecting either of the three dairy breeds, but as you have the foundation of a Holstein herd already started, why not continue and build up your herd from this small beginning?

Your cows are giving an excellent flow of milk, not a large flow for Holsteins perhaps, but good for the per cent of fat present. If your first cow is giving 58 pounds of 4% milk, she is making over 2.5 pounds of butter per day, and with such a starting point we should not make any hasty change to another breed without good and sufficient reason.

Farm Wagon only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmers Handy Wagon that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

HEESEN FEED COOKER

Get Your Money's Worth.

You will find this cooker by far the most satisfactory *in every way*. Absoutely full measure—(50 gallon size *not* stamped "70 gallons"); one-half cheaper than any other; simplest; lasts for generations; quickest in heating; most economical of fuel; coal or wood; 7 sizes, 15 to 70 gallons. Send for circular. *Money back if not satisfactory.*

Direct from factory to farmer. HEESEN BROS. & CO., 26 High St., Tecumseh, Mich.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

Guernsey Cattle.—The Old Homestead Herd has repeated in '99 its triumphs of '98. Winning nearly ¾ of all the prize money it contested for at the O., Ind., Ill., Wis., State Fairs. Also winning a signal victory for the breed at Ohio, being awarded the Grand Sweepstakes Herd Prize for best dairy herd any breed, against fifteen competitors for the cup. Address inquiries to L. V. AXTELL, Perry, Ohio.

GUERNSEY BULLS FOR SALE

Several young Guernsey Bulls of excellent breeding, from two months to two years old, at Glyndwr; by **OWEN BROS., Portage, Wis.**

Riverside Guernseys, CHAMPION Herd AT NEW YORK STATE FAIR, 1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Young stock by **COMUS**, sire of most of the winners, for sale. Thoroughbred Poultry—the best egg-producing and general purpose varieties—Leghorns, Wyandotts, Buff Ply. Rocks, Houdans. Send for circular. Stock for sale. **J. FORSYTH,** Riverside Farm, **Owego, Tioga Co., N. Y.**

ROSENDALE GUERNSEYS

Our herd has won first prize at the Wisconsin State Fair every year since 1894, and also won first at Minnesota State Fair and at the Trans-Mississippi Exposition in 1898. We keep only 400-lb. cows. Tuberculin tested.

Comments and Queries From Robinswood Farm.

The Law of the Survival of the Fittest in the Dairying World.—The N. J. Experiment Station and its Work.—The Improved Dairy Cow from the Point of View of Special Anatomy and Physiology.

ED. HOARD'S DAIRYMAN:—It is perhaps well that each oncoming generation of workers has no adequate idea of the intensity of the struggle for existence, of its hardness, or of the small chance for those who are least fit for the struggle, and who inevitably must go to the wall in the turmoil of the fight. But all may at least entertain the joys of hopeful anticipation—the greatest of joys.

In one of my previous queries, I asked as to the probable result if all dairymen became good practitioners of the art, fed balanced rations, kept specially developed dairy cows, etc. I can now see that there is no chance of any such condition of affairs until that millennial period when all men will be born equal in attainments, and with equal pecuniary and other advantages. When the church and multitudinous educational and reformative influences at work, shall have made all men good and unselfish, and when hygienic and sanitary sciences, shall have made all equal physically, then, and not till then may we expect to see all dairymen of such material as to make all equally successful. In the meantime, there are chances in dairying for the fittest followers of the industry, while the lazy, prejudiced, ignorant and weakly will have to submit to the inevitable and seemingly cruel law, and be more or less left behind in the race for existence. There will also be a legitimate and larger field for useful effort for the various periodical and other agencies at work in disseminating dairy knowledge, and in helping to make the avocation of pleasurable interest to those engaged in the pursuit.

There are probably lots of farmers who can see no use in scientific knowledge in connection with their calling. Why, if it were of no other use, it would be of enormous value in simply gilding with interest the dull routine of work. I know that in medical practice much of the routine drudgery would be almost insupportable if it were not for the scientific interest which attaches to everything connected with the work, and that there is always something new to learn.

Notwithstanding all the advance in scientific dairying during the past twenty-five years, there is evidently yet much to learn, and there is no reason to doubt but that the science will be one of perpetually progressive evolution.

There is a general law in force which especially rewards those efforts of the higher powers, special skill, perseverance, and concentrated application. Hence there is an opportunity for the individual dairyman, and there is an opportunity for our country in this specialty. But these opportunities are not soft-snap-walkovers. Society is willing to reward the dairyman, but only as an outcome of his special effort in the interests of society. The people want milk and butter at the lowest possible cost, and they want first-class products if possible. I have never heard of anyone standing around with a potful of money eager to bestow it on the dirty, careless, lazy or ignorant dairyman. I suppose that there are a large number of such, who think that society owes them a living, but society don't agree with them, and withholds that living.

I don't know that the brotherhood of dairymen wants to encourage the creation of new competitors in the vocation. Perhaps society, as a whole, would be benefitted if good butter and milk were even much cheaper than they are now, but that would be a condition of affairs that would not benefit the craft unless some methods for decidedly cheapening production should be discovered and practiced. It looks at present as if dairymen should be encouraged to efforts in the line of cheapened production, by reducing the number of cows kept, and increasing the individual capacity of those retained.

One of my most interesting visits of investigation has been to the New Jersey Experiment Station at New Brunswick. I went to talk with Director Voorhees, which I did nearly to his death, hoping among many things, which I wanted to be assured of, that the question of the practicability of growing, or buying protein, or other concentrated cow feeds had been accurately determined.

I judge that such knowledge is not as yet in existence, for if Prof. Voorhees don't know that point, it is not probable that anyone else does. The opinion of the station is that individual circumstances must determine the practicablity of such feeding. The station seems to be working along the line of producing balanced roughage feeds, especially, of soiling crops. The work of the station commands commendation, because there is no evidence of the impractical in the appointments and in the work.

The buildings are such as any ordinary well-to-do farmer might be supposed to possess. Nothing "fancy" about them. I was glad to see that the cows were not kept in the cellar dungeons, which is so common a practice in New Jersey and in Pennsylvania. Nevertheless, I think the state of New Jersey might afford a rather better model of an up-to-date dairy barn, than the one now existing.

The method of fastening the cows in the stalls was new to me. There is an endless chain for each cow's stall in the stanchion line, running over four sheaves, two at the center of the stall, and two at the side, the chain being boarded in at the side. The cow is fastened to this chain, in the center of the stalls, with an ordinary neck chain, and is given a large amount of ease of motion while kept in position in the stall, and with reference to neighbors. In the barn is a herd showing specimens of all of the prominent dairy breeds, and grades of the same. Some of them are highly specialized individuals, and others are general-purpose cows. All have the pronounced dairy form, and all looked like good milkers. There was one cow, that was my very ideal of a general-purpose dairy animal, fitted to make the best use of a wide ration; that is, one in which there would be a disproportionate amount of carbohydrates if fed to a highly specialized cow. She was a profitable milker, and yet had frame and muscle enough to put to some profitable use, at least, in veal, and ultimately in beef, the excess of carbohydrates that shall be given her in her food. That is certainly the best type of a cow for American agriculture as it now exists as a whole, producing, as it does, the wide ration; and unless it can be shown that it will pay to take extra pains and lay out more labor to grow crops, especially protein in character; or else that it shall be shown that it will pay to buy protein for balancing the ration, that is the type of a dairy cow that America will evolve out of the special improved European types, with which we are now working.

These types were created as a result of labor, conditions, climate and land values different from what exists in the North American continent, and it can be reasonably questioned whether, as created, they are the best forms for the American dairymen. We are, of course, enjoying the advantages of hundreds of years of effort on the part of European breeders, in our making use of these types; but it is a sure thing that all of these types will, in time, be evolved into different types more in harmony with the local conditions as they exist in the various sections of our great continent. With our climate, and with our corn crop in special, it is a sure thing that carbohydrate, wide ration feeds are very much more cheaply produced than those containing more protein. So far as I know, we have no climate which will produce such continuous protein-rich-pasture-feeding, as is found in the homes of the Ayrshires and of the Holstein-Friesians. Then again, the fact of possession of extended cheap pastures is a condition which will evolve a different breed from that created in the Channel Islands,

where land is quoted at $2,500 per acre.

What would the farmer there say to buying a whole one hundred acres and buildings and fences for $500, as sometimes happens in our New Hampshire region. However, I am pleased to believe that our Gilmanton farmers can beat the middle state farmers all to death, raising oats and Canadian peas, and there is protein for you. I am Jersey born, and live in New Jersey in the winter, but when it comes to farming I am New Hampshire all through. In this world it is every one for himself; every section for itself; and every country for itself—and the devil take the hindermost. That is all right. What would the world soon amount to, if the lazy, the ignorant and weaklings had an equal chance with the better blood in propagating and perpetuating their inferior qualities? It is right that the fit should survive, and the unfit be wiped out of existence.

The query is suggested: What is an improved type of dairy cow? It is evident that only a relative answer can be given. There can no more be one kind of an improved cow, any more than there can be one best breed, although there may be a similitude in all.

The cow which might be an improved type for me, might easily be unimproved, or else a degenerate type for another. No, that last is not right; for improvement implies progress upward. A scrub cow might, possibly, be the most profitable cow for a scrub farmer, but it could not be called an improved cow. In a general way, such an improved cow might be defined as an animal which is better adapted to transforming certain plants into dairy products, than cows previously used for that purpose. She is certainly not a beef cow primarily; milk and butter must be her promnient product.

So far, I have not come across any definition of the improved cow from the point of view of special anatomy and physiology. Viewed from this point, an improved dairy cow of the highest ideal is one in which the development of the milk-forming apparatus is so great, and is so perfect in its vascular, nervous and glandular construction, as to insure the diversion to its tissues of all of the blood manufactured by the cow, that is not necessary for the support of the purely vegetative structures, such as the muscular, circulatory and digestive systems; which latter structure must not be of greater extent than is necessary for a harmonious activity in the general working of the whole machine.

These vegetative systems are of course of primary importance, and must take large precedence of the productive systems; but none of them should be any larger than is necessary. Nevertheless, there is a practical limit to which the relative development of the milk producing apparatus can be safely carried. By skillful breeding, feeding and care the bony or muscular systems may be much reduced in their proportion to the mammary development; but there is also a limit here, for a certain strength of frame is necessary to support the other parts, and a certain amount of exercise is necessary to create and maintain vigorous health in the animal; but when it comes to the digestive, circulatory and respiratory systems, no reduction in them is allowable. A large proportion of the blood made must be used up in them to recreate new supplies, circulate it, and keep it in a purified condition, if the best production of milk is expected. The ideal dairy cow must be a well-balanced machine to be profitable in the long run. One can easily have too large a mammary development in a dairy cow. I have one such in my herd at present. She was born in such shape as to make so much milk as to weaken her general system and to induce udder troubles. But it is a sure thing that in the dairy cow, if the milk-forming apparatus is not sufficiently developed, a waste of food will result. The excess of created nourishment will be used up in the relatively too large general system, or it will pass through the body unutilized.

But not only must the improved dairy cow have the large mammary development, she must have equally with the beef cow the ability to digest and absorb from the food eaten its nutritive elements to the greatest possible degree. Cows, as well as human beings, vary largely in this capacity. The possession of a big appetite is no absolute criterion of the development of the digestive power. Some human beings are enormous eaters, simply because they cannot digest and absorb enough nourishment, and hence are always more or less hungry. I have seen some delicate invalids consume enough nourishing foods to support several individuals of healthy digestive ability, and yet not secure enough force from the food eaten to do a quarter day's work. It is so with cows. Some do not have the anatomical conformation or physiological digestive ability to economically convert food into blood, and thus supply the protoplasm of the milk-forming cells enough material from which to form milk. If this is so, it becomes more evident that a mere test for quantity of product is not satisfactory evidence of the real dairy value of the cow. Hence it becomes a matter of great importance that breeders should so manage their stock as to develop the peculiar digestive functions which are at the bottom of milk production. So far as my observations have gone, breeders pay little or no scientific attention to this point. They breed for large udders, external dairy form and large storage capacity for food, which may or may not be well digested, and they are apt to market their stock on the strength of a week's test, secured by forcing with concentrated and highly digestible food.

The manager of one of the most prominent herds in the country told me that he fed his calves to fatness, because that was the kind of looking calf buyers wanted, although he acknowledged that the practice was wrong. Well, of course, this is more the buyer's fault than the breeder's. It is evident that many dairymen have got something yet to learn. Perhaps it is too much to expect that breeders should create a product symmetrical in all good dairy qualities. Perhaps the dairy farmers can best furnish the constitution and digestive capacity,

Here's Another Instance

Where the other machine came out second best in a contest with the **Reid** Long Spindle Separator. In a letter from the Delta (Pa.) Creamery Co., under date of November 27th, 1899, Mr. Hitchcock, the manager, says :

"During a contest at our Delta Creamery between the Alpha and Reid Separators, ***I found the Reid to be decidedly the closest skimmer and very much the better machine to operate."***
(Signed) HENRY HITCHCOCK, Mgr.

And here's another case where the Reid proved itself to be the closest **skimmer.**

"Our Improved Reid Separator runs fine and does good work; no trouble at all. The State Inspector called the other day and I ran him a test of two samples; one was .015 and the other .02. ***He said my Reid beat the Alpha,*** *for he came from another creamery which used Alphas and their test showed .07 and .05. The Reid is O. K."*
Fairmont, Minn. *AMBER LAKE CREAMERY CO.*
(Signed) R. L. BRADBURN, Butter Maker.

These are but samples of many letters that we have received in praise of the

REID LONG SPINDLE SEPARATOR

Every one of which is a voluntary testimonial on the part of the writer to the merit of the most efficient skimming machine ever built. Read the concluding paragraph of the following letter from the Fayette (Wis.) Creamery Co. :

"Our new Reid Long Spindle Separator is skimming at the rate of 2,536 lbs. per hour. Yesterday two tests were made; one in the early part of the run and the other after the machine had skimmed about 6,000 lbs. The tests were made by our butter-maker in the usual way, and neither test showed more than a mere trace of fat. We are pleased with the machine in every way. It requires so little oil that it is hardly worth taking into account. One filling of the oil-cup will last for a run of 10,000 lbs.
This testimonial is not paid for—was not asked for—but is given as a voluntary tribute to a machine of merit" *(Signed) L. B. LOWRIE, Sec'y.*

Separator book, facts about pasteurization and the Reid Pasteurizer and catalogue of Creamery Supplies—all free if you write for them.

A. H. REID, 30th and Market Sts., PHILADELPHIA, PA., and CEDAR RAPIDS, IOWA.

South Dakota Dairy Convention.

The ninth annual meeting of the South Dakota Dairy Association and the first annual meeting of the South Dakota Butter Makers' Association were held at Mitchell, December 12-14, 1899.

The attendance was very satisfactory. The butter makers turned out in greater numbers than usual, and they seemed intensely interested in the proceedings. The supply and transportation men were there in force, and the commission men were in evidence.

The exhibit of butter consisted of forty-four tubs of creamery and four samples of dairy butter The quality was very good for this time of the year, when creameries are running but four, and some but three, days in the week. The average score was above 94 points.

The sessions were interesting and profitable, and everyone present was amply repaid for the expense incurred in attending. It was very much regretted that Prof. W. A. Henry, of the Wisconsin Station could not be present as announced. He was detained at home by sickness. John Armstrong, of De Smet, took up the subject of feeding the dairy cow, which was to have been handled by Prof. Henry. Mr. Armstrong is a practical dairyman, and has for several years been a close student of this subject. In his opinion the amount of profit in dairying is only limited by the way the cows are fed. A well balanced ration of prairie hay and bran and shorts means a yearly net profit of twenty to thirty dollars, per cow, over hit-and-miss feeding.

Mr. F. A. Leighton, of New Hampton, Iowa, read an interesting paper entitled "Rambling Thoughts of a Butter Maker." He took occasion to highly compliment South Dakota on the firm body of the butter turned out. He stated that at the Minnesota Butter and Cheese Makers' convention a tub of South Dakota butter was placed on exhibition, and the judge told him that it had the best body of any tub in the exhibit. This is certainly encouraging, for we know that Minnesota turns out some fine goods Mr. Leighton also stated that of the sixteen tubs of South Dakota butter entering the Genesee Salt Company contest, last summer, only one was marked off on body, and that would have been all right, had it been churned at the proper temperature. In speaking of mottles, he said that it was generally conceded that lack of moisture and salt was what caused mottles, and this being true, South Dakota butter should be free from them. "For," said he, "no other butter made in any other state, will stand so much working without injury to the grain as South Dakota butter" A great deal of the trouble with our butter arises from the butter maker using too cold water to wash his butter, which chills the granules and prevents the salt from becoming evenly distributed. He advocated the employment of inspectors and instructors after the plan of Minnesota. Mr. Leighton predicted a bright future for South Dakota in the dairy line.

Prof. G. L. McKay, of the Ames, Iowa, Experiment Station, was to have scored the butter, but a severe st rm detained him, and Mr. Leighton was pressed into service. He made note of the defects in each sample as he went along, and later gave a talk to the butter makers, telling them the cause of the defect and the remedy. Those who heard him said it was the most instructive lecture on that subject they ever listened to.

Prof. D. A. Saunders, of the Experiment Station, at Brookings, read an interesting paper on brome grass. It has been fully demonstrated that the smooth brome is the leader in tame grasses for the dairy, and it is especially adapted to this state. The college is making great efforts to get farmers to take hold of this grass, and as an inducement have furnished the seed at a very low price.

Prof. Wheaton and Prof. Stewart each gave interesting talks, and many other butter makers present took an active part in the discussions.

The members of the Butter Makers' Association held a meeting and decided to unite with the Dairy Association upon certain conditions, which were agreed to, and the name changed to the South Dakota Dairy and Butter Makers' Association.

The election of officers resulted as follows: President, Leland Griffin, De Smet; Secretary, C. P. Sherwood, De Smet; Treasurer, L. S. Tyler, Salem; Vice-Presidents: 1st circuit, A. B. Van Osdel, Mission Hill; 2d circuit, A. O. Johnson, Montrose; 3rd circuit, Victor E. Swanson, Clark; 4th circuit, S. S. Bately, Mitchell; 5th circuit, G. A. Lindquist, Newark; 6th circuit, W. F. Pidge, Highmore; 7th circuit, C. V. Gardner, Hill City.

The fact that a bill has been introduced into the lower house of congress providing for the taxing of colored oleomargarine 10 cents a pound, led to the sending of a telegram to our representatives urging their hearty support of the measure. If this product of the packing house can be forced out of competition with our creamery butter and placed on sale on its merits, the future of dairying is assured.

The people of Mitchell did all in their power to make our stay in the city pleasant. They seemed very much interested in the dairy industry, and evidenced their interest in a substantial way—the donation of their dollars to help make the meeting a success.

Mr. E. Sudendorf, secretary of the National Creamery Buttermakers' association, was present and urged that our state send a large delegation and a good exhibit to the annual meeting at Lincoln, Nebraska, February 19–23, next. In this connection we will state that negotiations are already under way for a special car and a low rate from our state, and there is no doubt that satisfactory arrangements will be made. Buttermakers and others who expect to go should notify the secretary early, in order to have accommodations secured in advance. A circular giving full particulars will be sent out in ample time.

The committee on resolutions submitted the following resolutions which were adopted by unanimous vote:

First—We the members of the Dairy and Buttermakers' Association, now assembled, wish to thank the good people of Mitchell for the entertainment and hospitality extended to us while in Mitchell.

Second—To the Business Men's League for their hearty support in making the different meetings successful.

Third—To the business men of Mitchell, who so generously contributed to the special premium list, for which all buttermakers will have best of wishes, and will long remember you all who have been so liberal with the buttermakers of South Dakota.

Fourth—We wish to thank S. S. Bately, who has done so much to make the meeting successful, and his efforts and success in getting the business men to contribute special premiums to the buttermakers of South Dakota who, will long remember him as their friend,

Fifth—We wish to thank most heartily Mr. F. A. Leighton for his attendance and very valuable paper and talk to the buttermakers, and for his careful scoring of the butter; also Prof. Saunders, for attending and taking part in our meeting.

Sixth—We wish to thank the press of Mitchell for their kindness in advertising the meeting and for the careful write up of our proceedings.

Following is the result of the score of the butter on exhibition as announced by Mr. Leighton:

J. P. Ibsen, Hanson (first)	97½
John Stranne, Mission Hill (2nd)	97¼

C. P. SHERWOOD. Sec'y.

De Smet, South Dakota, Dec. 18, 1899;

Cheap Butter.

ED. HOARD'S DAIRYMAN:—I do not wish to discuss that poor quality of butter that is only too plentiful, but do wish to give an account of the production of a first-class article at a low cost by a Hood Farm three-year-old, Torono's Lillian 137820, dropped July 11th, 1896; dropped her last calf, November 3rd, 1899.

For the seven days ending December 10th, 1899, she gave 255 lbs. 3 oz. milk that produced 15 lbs. 6 ozs. of as nice butter as ever graced a table, on a daily ration of 3 lbs. bran, 1 lb. corn meal, 2½ lbs. ground oats, 1 lb. oil meal, ½ lb. cotton seed meal, 30 lbs. silage and about 7 lbs. of hay (hay not weighed); containing 1.79 lbs. digestible protein, 9.92 lbs. digestible carbohydrates, 0.63 lbs. digestible fat. Total digestible nu-

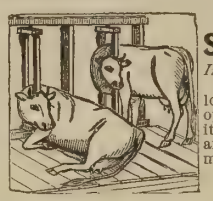
THE STRONG FENCE

Made of large wires, best spring steel, heavily galvanized. Provision made for expansion and contraction, so it is proof against all animals and all changes of weather. As nearly everlasting as anything on earth can be.

AMERICAN FIELD AND HOG FENCE

Sold by our agents everywhere. If you cannot find an agent in your town write direct to

AMERICAN STEEL & WIRE CO., Chicago or New York.



..THIS YEAR..

THE RURAL NEW-YORKER

SUBSCRIBERS are going to receive the prettiest and most valuable novelty ever distributed by the paper. It is the beautiful new climing rose, "RUBY QUEEN," originated by its editor on its own experiment grounds. Roses of similar merit usually sell for 75 cents to $1, when first introduced, but the Rural Experiment Grounds are conducted for the benefit of the readers of the paper, and novelties originated there are distributed free to yearly subscribers. Prizes of $10 for the best, $5 for the second and $3 for the third best cut flower of this rose will be awarded the second year, when it will bloom profusely. The subscription price of THE RURAL NEW-YORKER is $1.00 per year.

We will send it, including this Beautiful New Rose and HOARD'S DAIRYMAN both one year for $1.65

SEND AT ONCE before the supply of roses is exhausted. THE RURAL NEW-YORKER is by all odds the best farm and fruit paper published in any country in the world.

WILDER'S Swing Stanchion

Improvement over Smith's Steel latch; Automatic lock. Adjusts itself when open, so animal cannot turn it in backing out. SAFEST and QUICKEST FASTENING made. Send for testimonials

First order secures agency. Address FOLDING SAWING MACHINE CO., 55-57-59 No. Jefferson St., H-28, Chicago, Ill.

Personally Conducted California Excursions

Via the Santa Fe Route.

Three times a week from Chicago and Kansas City.

Twice a week from St. Paul and Minneapolis.

Once a week from St. Louis and Boston.

In improved wide-vestibuled Pullman tourist sleeping cars.

Better than ever before, at lowest possible rates.

Experienced excursion conductors.

Also daily service between Chicago and California.

Correspondence Solicited.

T. A. GRADY, Manager California Tourist Service, The Atchison, Topeka & Santa Fe R'y, 109 Adams Street, CHICAGO.

trients, 12.16 lbs.; nutritive ratio 1 to 7.

Comparing this with the American standard of 16.2 lbs. digestible nutrients, nutritive ratio, 1 to 6.9, it is a light ration and an economical one. Cows that are large, economical producers, are the kind we are striving to raise and are the kind that will return to dairymen a profit.

There is a reason for everything and this heifer is no freak but the result of breeding along dairy lines. Her sire, Torono, has been used to some extent in the Hood Farm herd and more freely since his daughters have begun to freshen, is a son of Sophie's Tormentor, sire of 17, from 14 lbs. to 19 lbs. 12½ ozs.—all on light feed. If this does not find its way to the waste basket, I will endeavor to report some of their year's work in the near future. JAMES E. DODGE,

Lowell, Mass. Hood Farm.

We beg to assure Mr. Dodge (who, by the way, is a graduate of the Wisconsin Short Course in Agriculture), that communications like the above, filled to overflowing with boiled-down statements of the facts of experience, never make the acquaintance of our waste basket, and that we cannot hear too often from him.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

UMBILICAL HERNIA.

I have a heifer calf that has a swelling right at the navel. It is not a rupture but seems to ooze out a little matter. I opened it but it does not go down. What can be done for it? I. N.

Toulon, Ill.

ANSWER.

I think you are mistaken. It is umbilical rupture, no doubt, but small. The pus is caused by the decomposing of the end of the cord. Such a condition needs a practical man, whether you or I are mistaken. If you should attempt to open this, you may do much damage.

BLOATING.

I have a cow, that for about six weeks before she calved, commenced to bloat at intervals; this finally became so serious, that I was obliged to knife her and insert a tube, to draw off the gas. After about twenty-four hours, I removed the tube, and she at once commenced to bloat again, till I found it necessary to keep the passage open all the time to save her life. This continued until she dropped a large bull calf. The wound at once healed, and she has done extra well at the pail this season. At about what age should the average cow do the best at the pail? H. S.

Little Valley, N. Y.

ANSWER.

1. Puncturing is of the long past. The flatus pipe is the instrument of rational treatment of the present day. Indigestion is the cause in your case of bloating. A dose of physic or two, would have done all needed, especially if an ounce or two of bi-carbonate of soda had been added.

2. From the fourth to eighth year.

GARGET.

Have a fine Ayrshire cow here quite sick. She cannot stand on her feet only a little while; her appetite is good; is fresh, about 8 weeks. Had a neighbor to tend her who gave physic, turpentine, sassafras and alcohol in warm water, but since, she is troubled with garget. L. D.

Garland, Pa.

ANSWER.

The physic was all right. Then the alcohol and turpentine counteracted the intent of the physic and did much harm, no doubt. Immediate full dose of physic and repeat in 5 days if needed. Rub the indurated quarters with strong camphorated spirits, six parts, common turpentine, two parts, only. Rub hard twice the first day, then only once a day for two or three days. Use much massage. Give good exercise in the sun. After the physic, give ten grains of iodide of potassa in a little water as a small drench, three tablespoonfuls of water or four. Give this for ten to thirty days, as may be needed. The iodide will not spoil the milk.

A SUDDEN DEATH.

My thoroughbred Holstein cow, Vesta, 6 years old, did not eat on Sunday as usual; on Monday morning I gave her one pound Epsom salts, two teaspoonfuls of ginger, and later two tablespoontuls of condition powder and fork full of hay which she ate. Being a pleasant day the cow was left out in the afternoon for a bath of sunshine, seemingly much better. The physic in several hours had the desired effect. When she returned to the stable she ate some fodder. About five o'clock she laid down very much in pain, and in ten minutes she was dead, without a struggle. Her feed consisted of corn stover, cut ensilage, all that they wanted twice a day, linseed meal, bran, oat meal. She was at no time constipated.

Mountville, Pa. J. G. S.

ANSWER.

Nothing short of a post mortem by a competent veterinarian could determine the cause of the death of the cow. There are several diseases which cause such sudden deaths.

FAILURE TO GET WITH CALF,

I have a Jersey cow that was two years old last May. She had a calf October, '98, when she was seventeen months old. I was advised to wait several months before breeding her again. I waited until August last before having her served, but have not been able to get her with calf, although she has been served three times. E. C. L.

Duluth, Minn.

ANSWER.

The cow requires a certain and effective emmenagogue. There are several, but the ones advertised in the DAIRYMAN are your best, safest, cheapest and all round to be recommended, as they are specially prepared for the disease in question.

WARBLES.

A few of my cows have lumps about the size of a 1 kernel peanut on their backs along backbone; seem to itch very much. On examination find they have a small hole in them and seem to be a kind of a grub worm.

How close to calving time, or the date a cow is due to calve, is the milk good, and how can I tell? This is with a cow that I can't dry up and want to save the milk as long as I can. How many milkings after a cow is fresh is the milk fit to save? I usually save the 10th milking, but have been told that is not long enough to wait.

Do you think it would pay to buy a cow 10 or 12 years old that has been a 2 to 2½ lbs. butter cow per day but has been failing last year and a half in milk. This cow is Jersey, fine animal and never had but one bull calf in 8 or 10 calves. I thought of buying her for breeding. Do you think a cow of this age or a young heifer will produce as good, strong, healthy and as good milkers as a middle aged cow? F. H. J.

Escondido, Cal.

ANSWER.

Yours is a common and well known condition, the lumps are the maggot or grub of the gad fly, *Borium oestrus*, or cow bot. They are quite common and are propagated from the ovary or egg of the gad fly, which punctures the skin and deposits the egg. Squeeze them out with thumb and fingers and then put a few drops of tincture of aloes and myrrh into the hole.

About five weeks. Third day, usually. Certainly not.

SCOURS.

I have a large cow seven or eight years old, that seems to have dysentery, or scours, badly. While on grass her droppings were thinner than other cows' droppings, but she gave a good mess of milk and seemed healthy otherwise. She went dry, took on considerable flesh, and then began scouring worse than ever, got poor, and seemed off feed. Then began eating again but still scours.

Edgerton, Kan. M. L. D.

ANSWER.

Follow the above course recommended for the same condition, nothing better to do. Systematic physicking will surely remove the scours. Not too close in the doses.

FISTULA.

I have a six-year-old mare that has bunches on one side of withers as big at times as a pint bowl, then it will dry away; have opened it twice; it discharged quite freely; then would heal; it never was a running sore. What is it, and what is the remedy? —

ANSWER.

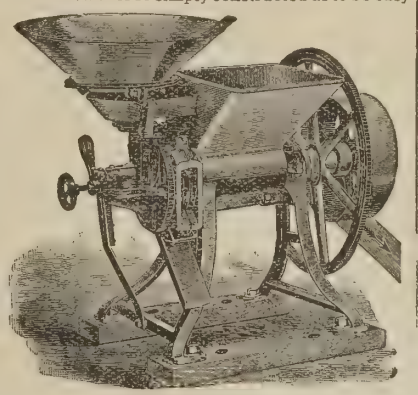
Fistula of the withers. This, like poll evil, is always bad to heal; cures are hard to accomplish, always. You need a practical man to attend to your case.

ATROPHY OF WALLS OF UDDER.

I have a Jersey cow that, last year, had a small lump grow in the front part of the left side of her udder, and she did not give quite so much milk from that quarter; was a little lumpier once for a few days. This fall when she came in, the lump appeared to enlarge very much but has gone down to about the size of an egg. She has been in now, about six weeks and the whole left side of the udder appears to be withering away. When I commence to milk, it appears soft as though it had been milked out; it then fills up some and milks more than one would expect but not so much as the other side which is very full at first. W. A. M.

Edenburg, Pa.

ANSWER.



Atrophy of the walls of the udder is not uncommon; rupture of the inner lining of the walls of the udder is also quite often to be found. The latter, in my opinion, is your case exactly. This explains the soft and changing condition of the udder as explained to me. For rupture of the inner lining I know no treatment of a rational nature. She may become much better by an effort of nature or may get worse.

ILLUSTRATION.

A STOCK FOOD GRINDER.

Cows require a certain amount of what is known as roughage in their food. They cannot digest pure corn or pure oats or bran to as good advantage as they can when it is mixed with some coarse feed. Corn cobs make excellent roughage when properly prepared. A. W. Straub & Co, of 3737 Filbert St, Philadelphia Pa., have for long years been manufacturing the Quaker City Grinding Mill, a machine intended for farmers' use. It may be driven by wind or horse power or water wheel

The value of this machine on a stock farm is certainly very great. It will grind corn on the cob corn and oats, or wheat or barley for breakfast food, and is so simply constructed as to be easy

of operation by an unskilled man Country millers charge a large percentage of the amount of grain for grinding it. The farmer is at the expense of hauling it to and from the mill, and there is more or less wastage. On the other hand if the grain is fed without grinding at least a quarter of its nutritive value is lost. The Quaker City Grinding Mill enables the farmer to do the work at home in odd seasons These machines are also handled by The A. W. Straub Co., at Canal and Randolph Sts. Chicago, Ill. Write to either house for catalogue, circulars and full information.

Horse Owners! Use

GOMBAULT'S

Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

Every bottle sold is warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars.

Meeting of the Georgia Dairymen's Association.

ED. HOARD'S DAIRYMAN:—It had been given out that this would likely be the "greatest dairy meeting ever held in any southern state," and several favorable conditions conspired to fulfill the promise. President Brown, of the Georgia Agricultural Society, says that this is a "transition period in southern agriculture," and certain it is that many farmers are turning from the all-cotton system to other branches of agriculture. The Georgia Dairymen's Association is guiding many of them into intelligent dairying. This condition greatly favored a successful meeting. Then the railroads of Georgia very generously granted free transportation to all members, which, of course, contributed largely to its success.

Some two hundred and fifty farmers, more or less interested in dairying, gathered at Grantville to hear the many dairy problems discussed by men who had successfully worked them out. Besides well known men from our own state, there was on the program Mr. George F. Weston, of the Biltmore Farms, N. C.; Dr. Cooper Curtice, State Veterinarian of N. C.; Mr. H. E. Weed, formerly Entomologist at the Mississippi Agricultural College; Major Henry E. Alvord, Chief Dairy Division U. S. Department of Agriculture, and others.

Major Alvord said that it was the most interesting meeting ever held in the South, and that very few states in the Union had as healthy dairy organization as Georgia. This association was founded in 1894 through the persistent efforts of Director R. J. Redding, of the State Experiment Station, who has been president since its beginning. His annual addresses, printed in the proceedings of each year, have done much to stimulate dairying in Georgia. Mr. H. J. Wing, Dairyman at the Experiment Station, has also rendered valuable service to the Association, and given much encouragement to the industry. His important investigations into the subject of "Tick Fever" are invaluable. This subject, of vast importance to southern dairymen, was ably discussed by Dr. Cooper Curtice, of N. C.

"The Selection and Care of a Dairy Herd" was discussed from the standpoint of a successful breeder, by Mr. George F. Weston, Superintendent of the famous Biltmore Farms of Mr. George Vanderbilt.

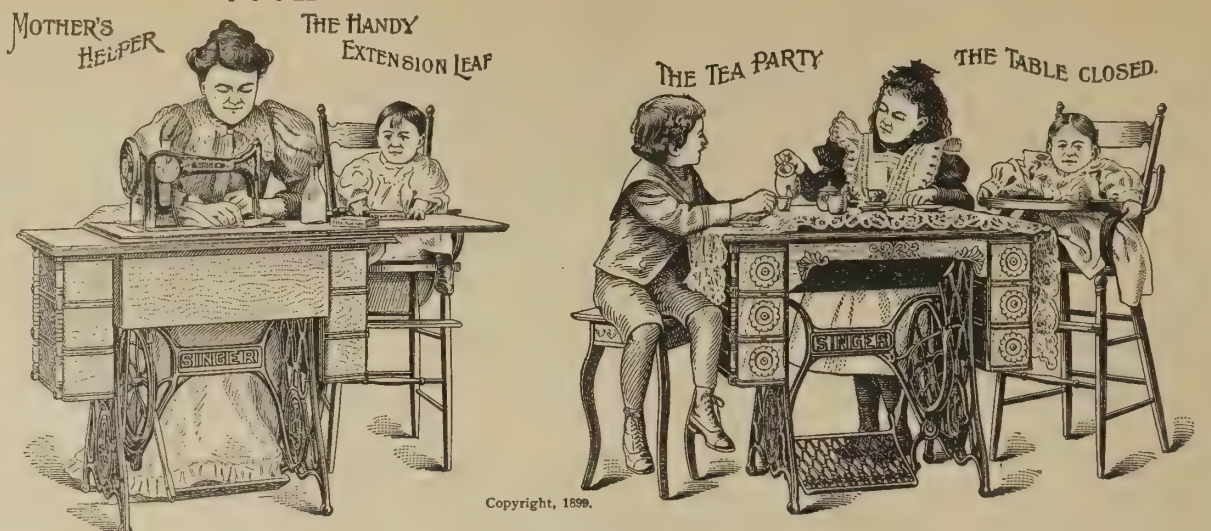
"My Experience in Dairying" was cleverly related by Mrs. M. E. Wilson, who has had a very pleasant and successful experience. President Redding said it was the very best address ever delivered before the Georgia Dairymen's Association. The Assistant State Commissioner of Agriculture, Col. R. F. Wright, discussed "The Enforcement of Georgia Dairy Laws." As in other states, much oleomargarine is sold in Georgia, and "they all think they are eating butter." One of the practical results of this discussion was an act just passed by the Georgia Legislature making it the duty of the Department of Agriculture to inspect butter through the Oil and Fertilizer Inspectors.

Mr. Howard Evarts Weed spoke interestingly upon the important subject of "Winter Pastures," and recommended hairy vetch sown with rye as best suited for this section. Prof. Hugh H. Starns, of the State University, gave the results of his studies and observations on "Farm Fences," having spent several years investigating the subject both in this country and in Europe.

Mr. C. B. Gold, editor of *Dixie Dairyman*, of North Carolina, addressed the Association on "The K. W. T. D. (know what to do) in Dairying," demonstrating the value of intelligently directed effort in this industry. The Association is doing a great work in giving intelligent direction to this new industry in its very beginning, and before old false theories and habits are fastened upon the dairymen of Georgia. This indeed is the main purpose of the organization, and it is encouraging to know that much along this line is being accomplished.

President J. Pope Brown, of the Georgia Agricultural Society, spoke on "The Transition Period in Southern Agriculture," from the all-cotton system, which has well nigh bankrupted so many farmers and impoverished their farms, to the more remunerative and rational system of dairying and diversified farming. According to the views of President Brown and other intelligent observers, the south, and especially Georgia, is now in this hopeful "transition period."

It is impossible to give even a brief synopsis of these and the many other able addresses in the limited space of this article, but the whole of the two days' proceedings, including all of the formal addresses and the informal discussions, stenographically reported in full, will be printed in the proceedings, which are now in press, and will be widely distributed both from the secretary's office and the office of the State Department of Agriculture. Copies may be had upon request.



I must, however, briefly refer to the very able address of Major Henry E. Alvord, in the course of which he expressed the opinion that as Georgia had been the world's best market for dairy products, she would yet be the foremost dairy producing state of the Union.

He stated that in Great Britian alone the demand for butter each year was ten thousand tons more than the year before, and that most of this butter was produced in Denmark from cows fed largely upon grain grown in our western states, and cotton seed meal produced in the South. He earnestly contended that instead of selling these raw materials we should feed them at home, and get the larger profits resulting from the finished products, saving both the freights and the profits to ourselves. This able address made a profound impression upon all, and Major Alvord was given nearly the whole of the night session.

This is the second time that he has attended our meetings, having met with us at Macon, in 1897, and he expressed gratification at the progress of dairying as shown in the character of the butter exhibited at this meeting. Much disappointment was felt at not having Gov. Hoard with us as we expected, but the meeting of 1900 will be fixed at a date for his especial convenience, and a large and intelligent audience of farmers and dairymen from every section of Georgia will meet with him to discuss practical dairy problems. I may in a future article call attention to some of the definite practical results of the efforts of the Georgia Dairymen's Association during the six years of its existence.

Sparta, Ga. M. L. DUGGAN, Sec'y.

THE SINGER CABINET TABLE.

Copyright, 1899.

MADE AND SOLD ONLY BY

THE SINGER MANUFACTURING COMPANY.

SALESROOMS IN EVERY CITY IN THE WORLD.

DON'T RUN THE RISK.

Don't buy a "pig in a poke." Don't risk a failure by feeding something you can know nothing about. Feed sold in bulk without a guarantee of purity and value behind it, is sold that way because no one is willing to back it up. There's no risk or failure, no experiment in feeding Quaker Dairy Feed.

QUAKER DAIRY FEED is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal. *Sold only in Sealed and Branded Sacks.*

"Modern Dairy Feeding," an invaluable book, containing scientifically proportioned rations, including every form of roughage and every variety of feed. Sent postpaid on request. Scientific advice on feeding—FREE. Address, **SCIENCE DEPT.,**

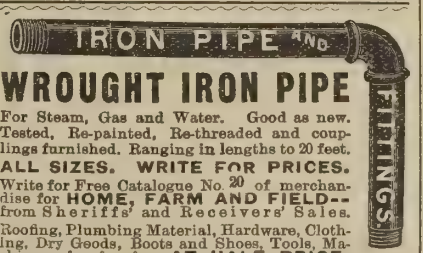
DON'T ROB YOUR NEIGHBOR

By buying a poor fence that will let your stock fatten on his crops. The **KITSELMAN FENCE** is a satisfactory one. It insures good sleep and makes good neighbors. Free Catalogue telling how to make 100 Styles at the actual cost of the wire. Write to-day.
KITSELMAN BROTHERS,
Box 57 Ridgeville, Indiana, U. S. A.

Water in the Stable a Necessity.

It is now regarded as a necessity that stock in the stable should have constant access to water of suitable temperature. The dairyman who today turns out his cows to drink, is as far behind the age as the farmer who cuts his grass with a scythe, or rakes it up with a hand rake. Write for descriptive catalogue of the best known and best System of watering Devices for Cattle in Stables to
C. E. BUCKLEY & CO., Poughkeepsie, N. Y.

Absolutely perfect. Soon pays the cost. Cheapest because best.
Water always fresh. No disease where used. Send for catalogue.



CHACE'S Watering Device

The most perfect watering device on the market. It is fitted with a brass bushing that screws through the bottom of basin and forms a valve seat for the ball valve. The ball valve is the most practical of any now in use; it has been adopted by manufacturers of injectors for steam boilers, and many devices where a perfect working valve is necessary. Send for circular and price.

THE HANDSOMEST CATALOGUE OF 1900.

Last year we printed and distributed 300,000 catalogues. This year we printed and shall distribute 350,000 catalogues of the now world famous "PLANET JR. GOODS." Our last year's catalogue was acknowledged to be the best, most instructive and handsomest catalogue ever issued devoted to a similar subject. Our 1900 catalogue will be superior in every way to that one. It is profusely and handsomely illustrated with photographed farm scenes from all Europe, Australia, South America and other foreign lands. In addition to being beautiful it will be most instructive as to the quality and utility of the goods it represents, and as to the agriculture, gardening, etc., of foreign lands. The new catalogues are now ready and will be mailed free on application.

S. L. ALLEN & CO.,
Box 1107-D, Philadelphia, Pa.

Sole Manufacturers,
De Kalb, Ill.

Save Half Your Feed

by cooking the other half. Experienced feeders know that this problem works out to a surety. This is not the only gain in cooking feed however. ***All cooked feed is digested*** by the animal economy, and none of it passes through whole. Young things grow more rapidly and mature stock fatten more quickly on cooked feed.

The ELECTRIC FEED COOKERS

are undoubtedly the best for preparing the feed. Made from the **best gray iron castings,** lined with **steel plates, with special galvanized steel** boilers. Three styles, five sizes, 25 to 100 gals. capacity. We publish a **FREE BOOK ON FEED COOKING** which tells all about these and deals extensively with the subject of stock feeding. Send for it.

ELECTRIC WHEEL CO., BOX 130, QUINCY, ILLINOIS.

F.B.W. Co.

The New Book FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

HOARD'S DAIRYMAN.

Devoted to Dairying and Dairy Stock Interests.

Medals—Bronze 1878, Silver, 1887, World's Fair, 1893.

A Vat. JUST A VAT. That's All.

Oh, Yes! But There's a Difference in Vats.

There are **Sharples Vats** and other vats. The difference between a Sharples Vat and another vat is that a Sharples Vat is made right and intended to be sold on its merits, while other vats are made the cheapest way possible to be sold by different members of the Creamery Supplies Trust who hope to sell at a large profit by pretending to the honest, unsuspecting creamerymen that they are competitors, when as a matter of fact they all belong to the same combination. When you buy a Sharples Vat you get your money's worth; you get a vat made from the best of material, free from knots, thoroughly seasoned and better finished than any other vat made. One of our natural wood finish cypress vats will brighten up your factory like a beautiful piano sets off a parlor. The Sharples vats are properly put together, the joints are perfect, the lining is of the best tin manufactured, and firmly braced so as to avoid bulging from water pressure underneath. We can furnish them to suit your ideas; round bottom; flat bottom; self-draining bottom; large or small; natural wood finish or painted any color; lined with tin or copper. Every vat warranted strictly high grade. There is a certain very desirable peculiarity about our goods and it is known as **SHARPLES QUALITY.** It appears in our vats and also in the following specialties:

The "Squeezer" Combined Churn and Butter Worker.

Rightly designed—rightly constructed. Easily operated. Easily cleaned. In no way complicated and its work is perfect.

The "All-Over" Butter Printer.

This popular printer has been on the market but a short time but its many desirable points have created a demand for it far beyond our expectations. It prints six sides of a pound print at once if so desired, is rapid in its action and easily adjusted to meet varying conditions of butter.

When placing your orders bear in mind that we are prepared to furnish you with machinery and apparatus of the highest grade and that our goods

Are Not Controlled by the Trust.

THE SHARPLES CO.,

28, 30 and 32 So. Canal St., Chicago, Illinois.

FACTORIES { West Chester, Pa., And Dubuque, Iowa.

THE POINTS THAT COUNT.

The separator which recommends itself to the thoughtful creameryman is the one which other creamerymen have found absolutely reliable in every particular; the one which has proven itself in actual use as being the superior of every competing machine; the one which the manufacturer is ready to place in the hands of every creameryman who intends buying a separator, with the distinct understanding that the machine must be exactly as represented or no sale; the one which can be secured for trial without signing a skillfully worded contract which means an enforced purchase of the separator whether it is wanted or not. Such a machine is the

Sharples Tubular Separator.

The following letter merely repeats what is being said of the **"TUBULAR"** by prominent creamerymen in all parts of the world.

WACKER, ILL., Dec. 12, 1899.

Gentlemen:—

In regard to the Tubular No. 25 we bought of you last June, will say, I think it is the best separator on the market to-day. It is very simple and easy to run and I think it will last a lifetime; that is one good thing,—it is the lightest running separator I ever saw steam turned on. As to clean skimming, will say it can not be beaten; I have tested the skim milk very closely and 2-100 of one per cent. is the most fat I have ever found on a sample, and I have taken samples that I could discover no fat at all. I have tested the milk from a good many different separators, but have never found any that tested as low as the Tubular. The cream is delivered in so smooth and quiet a way that it is no trouble to make the finest grade of butter from it.

Hoping the sale of the Tubulars will be large, I remain,

Yours truly,
G. W. MYERS,
Mgr. Deer Creek Creamery.

It will pay you to give the Tubular a trial; it will demonstrate to you that our competitors need a one-sided contract when they come in contact with the Tubular. You can get a Tubular on the most simple contract ever written. A short letter like this will bring one to you quickly.

Please ship to me a Sharples Tubular Separator. I will immediately put it into my factory and will give it a fair and careful trial. If I like it in every respect, and it does all claimed for it, I will keep and pay for it. If it fails to suit me for any reason I will notify you to that effect, and on receipt of instructions from you will reship to your order as you may direct.

A CLEAN, RAPID, SUPERB SKIMMER,
OF LARGE CAPACITY, SIMPLE, DURABLE AND EFFICIENT.
TRY IT.

The Reasons for the Superiority of the Improved United States Separators

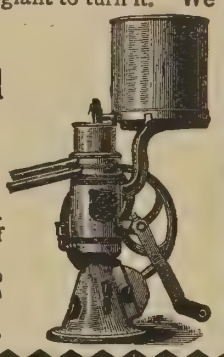
are well known to all who understand the principles of

CENTRIFUGAL SEPARATION.

For the enlightenment of those who do not understand these principles, those who have not studied into them and wish to understand them, we will send a catalogue explaining and illustrating separator facts and differences for the mere asking.

THE IMPROVED UNITED STATES SEPARATORS embody principles contained in no other, which makes them **more efficient in operation,** more simple in construction and greater wearing qualities.

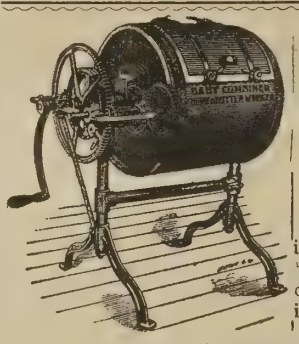
The rapid increase in sales is phenomenal. None can truthfully boast of such a record.



VERMONT FARM MACHINE CO., Bellows Falls, Vt.

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the



Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. charms every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

Gluten Feed

is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it. Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating the "Value of Butter Fat in Milk," all FREE if you address

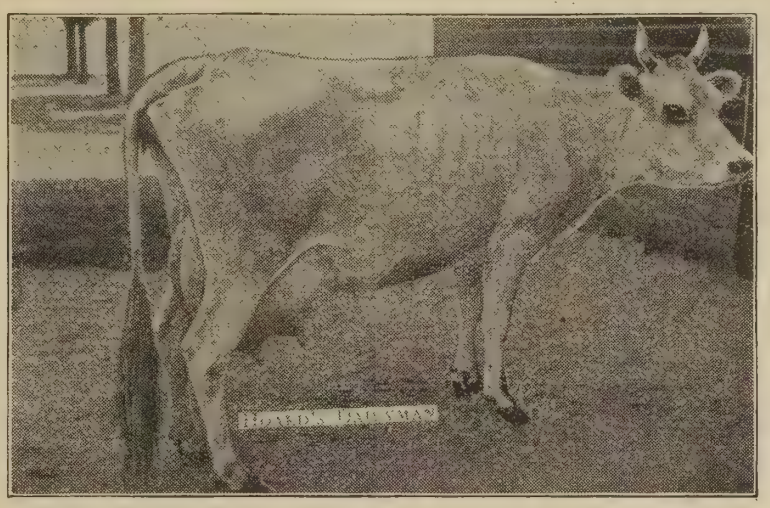
Reading notices, 50 cents per line (nonpariel measure) each insertion.

A NOTED JERSEY HERD.

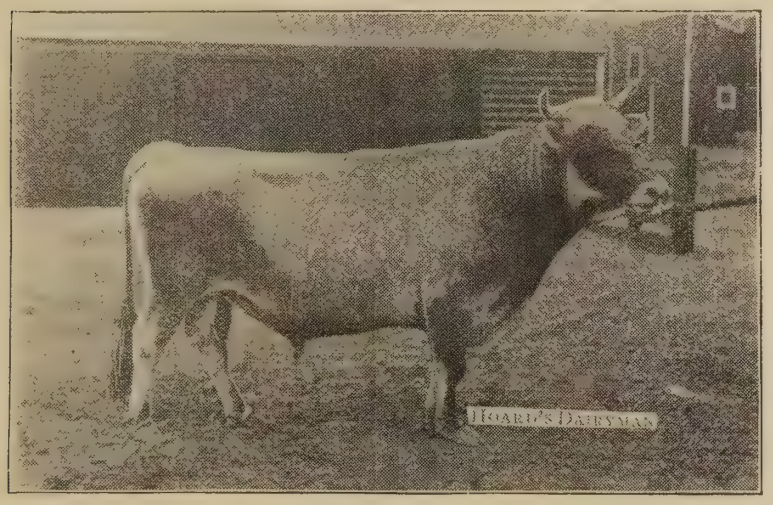
A study of a herd of dairy cattle, which represents a high degree of development, and at the same time demonstrates the owner's enterprise, study and skill as a breeder and developer of such cattle, can never fail to be of interest and profound instruction to the earnest student in these lines.



We had heard and read much of the fine Jersey herd owned by Mr. Frank W. Hart, at Painesville, Ohio, and a few weeks since, while on a trip east, we concluded to visit this herd. Mr. Hart is a wholesale merchant in millinery, carrying on one of tbe finest establishments of its kind in the west. He is a keen, thorough business man, and adheres in everything he handles, to close business methods. He took up the breeding of Jerseys about the year 1893, from a strong innate love of the dairy cow, and rural affairs. He commenced first, with the grand old cow Lorna 2nd 33634, and she is still the matron of his herd with five of her daughters by different sires, all of them grand cows in every particular. This presents a striking example of maternal prepotency. He made a special study of the Jerseys at the World's Fair, and at every other opportunity, until he felt himself competent to administer a sound judgment in the collection and construction of a representative herd of these cattle. Besides the cow Lorna 2nd, was presented another splendid study in the person of her son, the bull Marigold Pedro 42643, whose likeness we present in this issue. He is a bull of great impressiveness, and, combined with his sisters, gives us an enlarged idea of what should characterize a grand cow—a great performer at the pail and *still more* the producer with great *certainty* of prepotent sons and daughters.

An examination of Marigold Pedro disclosed, besides an almost faultless outline, the possession of a wonderful development of the rudimentary teats, widely placed lengthwise of the body, and well forward of the scrotum.

None of his heifers are in milk, but finer udders and teats we have never seen, than they present. It was a clear demonstration of the practical value of this feature in the sire. It is beginning to be pretty well understood that the sire largely determines the shape of the udder in the coming cow. If the rudimentary teats are widely placed, and of good size, it is a strong indication that the udders of the resulting heifers will be square and well shaped.



Another special study in dairy breeding was the wonderful bull, King of St. Lambert's King 30752. Mr. Hart has, with great enterprise, brought together from all parts of the country into his herd, every registered daughter of this wonderful bull. There they stand, sixteen in number, and we doubt if there exists in the country, such a demonstration of the prepotent power of a sire to impart to his daughters great productive capacity. Lack of space compels us to cut short further comment on our visit, but we will say in closing, that if there is any man in the country who is a doubter of the superior value and desirability of "special-purpose" breeding, a visit to the herd of Mr. Hart, we think, will surely convince him of his error.

We present this week, illustrations of three animals from Mr. Hart's herd. The cow Gazette's Fawn 93704, tested 25 pounds, 4½ ounces of butter from 333 pounds milk in seven days. Gazette's Fawn is a sister of King of St. Lambert's King. The other, the four-year-old cow Luella K. of St. Lambert 126949, tested 20 pounds, 6 ounces in seven days. Lastly, the bull Marigold Pedro of which we have spoken. A study of these three spendid dairy animals will show how strongly they confirm the constant declaration of the DAIRYMAN, that the dairy form is the basis of successful and profitable dairy production.

Feeding Fat Into Milk.

A Practical Experience.

ED. HOARD'S DAIRYMAN:—In reading over some late numbers of the "DAIRYMAN," I noticed the old question that constantly "bobs up serenely" as to feeding butter fat into cows' milk. If you remember, a number of years ago you and I used to argue that question, and I believe in that early day I found myself on the wrong side of the argument until I learned better. The circumstance that taught me better was this. You remember in the fall of 1889 I won the greatest butter prize with my herd of Holsteins at St. Paul, of any dairyman that ever won in the United States, and under the strongest competition. In a previous year I put in four cows to make butter. I think this test might have been the year before that. I had tested these cows at home, and the one I had got the most satisfactory results from made me three pounds of butter. I put what I considered my best cows together expecting to have no trouble in making the wonderful record. My cows made the most milk but lost in making butter.

After visiting one or two other state fairs, I brought up at the South Dakota state fair, at Aberdeen, and there I learned the lesson that I remembered all my life. Of the two cows I depended to do my wonderful work with, one of them went wrong, and left me what I considered one of my inferior cows to go into the record with another cow which was a prime favorite of mine. I kept these cows separate, and had the milk and butter tested. I won with Aggie Abbekerk, and much to my surprise the butter fat in her milk, tested under the Babcock test, was 5¼ per cent, while my cow that I thought was doing my wonderful work, and had given me 100 pounds of milk in a day, was only 2 per cent. I had her tested several times after that, and I found, much to my surprise, that the cow I was pinning my faith on, while she gave from 75 to 100 pounds of milk a day, was producing only 2 per cent butter fat, while the other cow that I had not considered so good produced from 4½ to 5 per cent in richness. Now I commenced to feed the low tested cow, and gave her the richest foods there was, in the best manner I knew how to feed, but I never could change her percentage. Afterwards it fell to my lot to test my other cow under different circumstances. This was on the farm and at a time when we were not feeding for any special purpose. This was during the winter when the cattle had nothing but straw and bran—not very much bran at that. And with only these foods the butter fat contained in the milk of the Aggie Abbekerk cow still kept up to 5 per cent. This opened my eyes, and I spent many an hour trying to solve the problem.

I think this is the first time I ever put any thing on paper in regard to my experiences along this line. But noting the experiments that have been made at Cornell and other state experiment stations I thought possibly you would be interested in having my experience along that line, because it thoroughly convinced me that you could not feed one particle of butter fat into a cow. But I arrived at this conclusion: You could put the butter fat into the cow one or two years before that time, or a year or two before she was born, by having the right sire and dam, and then the year before you put the cow to the test, keeping her in as good condition as possible. I believe that is the true solution of the question, that while you cannot feed the butter fat into the milk you can feed the butter fat into the cow, and later bring it out through the processes of the cow, that seems so dark to us. I. C. WADE.

Atlanta, Ga.

FOR WARTS ON HORSES AND CATTLE.

One of the nuisances of animal life is often found in the growth of excresences or warts. An experienced dairyman in New York not long since gave us the following recipe for troublesome warts on cattle or horses: Sandpaper the wart till it bleeds a little. Then powder blue vitrol, mix the same with vaseline to a thick paste and rub on. In a little time the wart will separate from the flesh and drop out.

Prince Edward Island, Marshfield.
Michigan Dairymen's Association. Detroit.
Creamery Buttermaker's Association, Lincoln, Neb., Feb. 19-23, 1900.

AT the recent meeting of the State Grange in Lock Haven, Pa., Dr. H. P. Armsby, Director of the Pennsylvania State Experiment Station, gave an address upon the education of the farmer, presenting a brief review of the past history and present status of agricultural education in the United States, and particularly in Pennsylvania. At the close of the address resolutions were offered and subsequently adopted, providing for the appointment of a special committee to consider the subject of agricultural education in Pennsylvania and report its conclusions and recommendations at the next meeting of the State Grange.

It is to be hoped that the trend of sentiment in the old Keystone State, upon this important question, is in the direction, among other ways, of teaching the elements of agriculture in the common schools. A generation of farmers' boys educated in that way, would furnish a hundred times more graduates from agricultural colleges than the present system produces. A taste for the *study* of agriculture must be implanted in the young if they are to make good farmers or good agricultural scientists in after life.

SILAGE CROPS.

The reports concerning sweet corn for silage are quite conflicting. Some say that it has a tendency to make a very sour silage, and others claim that it is as unobjectionable in this respect as any. If we had the sweet corn growing, we would not hesitate to put it in silage, but we would not plant it especially for this purpose, neither would we plant kafir corn for silage when the ordinary maize grows to perfection. Kafir corn is especially adapted for semi-arid climates because of its drouth resisting capacity. We are not aware that teosinte has ever been tried in the silo, but alfalfa has been, and very successfully so, especially in California.

A VALUABLE BOOK.

The Sixteenth Annual Report of the Wisconsin Agricultural Experiment Station (for the year ending June 30, 1899) has been received and, although not as carefully studied yet as it will be, enough has been observed to justify the statement that it is indeed a valuable book.

Naturally enough HOARD'S DAIRYMAN is most interested in the topics treating of cows and dairy products, and it is gratified to find these subjects occupying nearly half of the 332 pages of the report.

The record of the Station's dairy herd, pages 68 to 88, is especially valuable, and will be quoted and referred to again and again, by every writer on dairy topics, and especially by those who champion the merits of the so-called dual-purpose animal, for it was a cow claimed to belong to this class that showed the largest product, the largest net profit, and the lowest food cost for butter. This cow's sires for four generations were pure-bred Shorthorn bulls, but whether of "a milking strain," or otherwise, is not stated. Her record for 326 days is 10,163 lbs. of milk containing 433.82 lbs. of butter fat, the equivalent of 506.12 lbs. of butter. The total feed consumed cost $35.06, and the total value of butter and skim milk was $114.92, butter being credited at 20 cents per pound, and skim milk at 15 cents per hundred pounds.

This paper never quarrels with an established fact, and it therefore accepts this record as it is, and without qualification or reservation; but looking at the picture of the cow, as printed with her record, we cannot agree with Prof. Carlyle's statement, that "there is nothing particularly noteworthy about her general appearance, judging her from the standpoint of a dairy cow." On the contrary, she presents to us almost a faultless dairy form, despite any defects her udder may show; and if she is to be accepted as a fit type of the dual-purpose cow, it looks as though all controversy on this subject might be postponed, and this more especially if it can be shown that this cow and others like her, and of similar breeding, can be depended upon to produce heifers of similar dairy ability.

The Annual Reports of the Station, and its bulletins, are sent free to all residents of Wisconsin upon request.

A LIBERAL PREMIUM LIST.

The Wisconsin Dairymen's Association takes this opportunity publicly to acknowledge the following contributions to its premium funds for 1900:

HOARD'S DAIRYMAN	$ 25.00
Genesee Salt Co	25 00
DeLaval Separator Co	25.00
Worcester Salt Co	25.00
Wells & Richardson Co	25.00
Creamery Package Manfg. Co	25.00
Cornish, Curtis & Greene Manfg. Co	20.00
The Heller & Mertz Co	15.00
Diamond Crystal Salt Co	10.00
Hon. Jesse Stone	10.00
Anonymous	25.00
Totals	$230.00

The Association tenders its thanks to these donors, with the hope that the dairymen of Wisconsin will reciprocate the good will which has prompted them to thus assist in making the convention of 1900 memorable in liberal premiums, and will add enough to above amount to make a total of at least $500 to be distributed in cash premiums to Wisconsin dairymen as follows:

Herd Premiums	$150.00
Class I Dairy Butter	75.00
Class II Creamery Butter	175.00
Class III Print Butter	15.00
Class IV Cheese	125.00
Sweepstakes	10.00
Totals	$500.00

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude* fat. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

A CALIFORNIA RATION.

I have been taking the DAIRYMAN for the past few months and have enjoyed reading it in that time and expect to profit by reading it in the future. Have just purchased a dairy consisting of 76 cows and heifers with about 50 cows milking. They are mostly high grade Holsteins, the party having used throughbred bulls for the past few years. I want to feed for a large flow of milk, as my business will be selling milk to a retail trade. Kindly furnish me an economic ration from the following feeds:

Roughage, alfalfa hay, $7 per ton; oats (this is the native wild oats), $6 per ton; wheat, $7 per ton; wheat and oats mixed, $7 per ton, with good clean straw fed in outside racks to run to; bran, $15 per ton; middlings, $17 per ton; barley, crushed, $17 per ton; corn meal, $22 per ton; oil cake meal, $30; oats, ground, $23.

The cows are in all conditions from fresh to those that are being dried off for calving and will weigh from 900 to 1200 lbs.

Stockton, Cal. R .L. W.

Of course with such a herd as this and with cows in all periods of lactation, it would be supreme folly for anyone to take a a formula for a ration and feed it indiscriminately to all the cows without regard to their ability to respond. We are of the opinion, however, that the following combination of feeds in the amounts specified would make a good average for this herd:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. alfalfa	9.16	1.10	3.96	.12
10 lbs. oat hay	9.11	.43	4.64	.15
4 lbs. bran	3.52	.50	1.93	.15
4 lbs. corn	3.56	.32	2.67	.17
Totals	25.35	2.35	13.20	.59

COTTON SEED MEAL.

A subscriber at Fort Edward, New York, is feeding corn stover, hay, corn and cob meal and bran, and wants to add some cotton seed meal. A neighbor has advised him to add about a handful to each feed and he has done so for about four days but sees no increase in the flow of milk. He asks us how much he can use and wants us to give the amount by measure as he has no facilities for weighing.

We are of the opinion that he ought not to expect returns in a very appreciable amount in so very short a time or for so very small a quantity. Cotton seed meal weighs 1 lb. and 9 oz., or about that, to the quart, and we do not consider 2 lbs. per day an excessive allowance. It is better, however, not to commence with so much as this at first.

It is perhaps possible that these cows have become so firmly established in shrinkage of milk flow that no amount of feed will materially increase the present yield.

A KICKING HEIFER.

F. K., Parkdale, Mich., has a Jersey heifer, due to calve January 24th. Whenever he gets near her she is very apt to kick or hook, or otherwise manifest a spirit of fear and self defense. His inquiry is what he shall do to overcome this trouble. The answer is to treat her as he would treat a young horse addicted to the same conduct. No blows, no straps, no scolding, but in every possible way get this heifer to understand that her owner never intends to hurt her, and is her best friend. Give her a daily lesson, and let each lesson last long enough to convince her that it is absolutely unnecessary for her to kick or hook or do anything else to protect herself. Be gentle, be kind, be patient.

He asks how to feed this heifer, but gives no list of feeds available.

IT IS NOT REASONABLE.

Is it reasonable to expect a good flow of milk from the following: Cows, grade Jerseys from 700 to 1,000 lbs., milking for butter; wheat bran, 3 lbs.; oat chop, 3 lbs.; oil cake meal, 1 lb.; corn meal, 1 lb.; good oat straw, all they will eat?

Please formulate a ration for us from the above. R. T. O. S.

Tweed, Ont.

The above is a very pertinent question, and it is one that a good many dairymen ought to ask themselves. A cow has been compared to a cupboard in that you cannot take more out than you put in.

We have a good deal of respect for good oat straw, both for horses and milch cows, but it needs to be supplemented with a very liberal allowance of grain, if you expect the horse to do much work or the cow to give much milk. There are very few men who would expect a horse put to hard work every day, to hold his own on oat straw and 8 lbs. of grain, but it is just as reasonable to expect this of the horse as it is to expect that a cow will yield a paying mess of milk on a similar allowance of feed. In our opinion the following allowance of grain is as little as one ought to think of supplying to a cow with no other roughage than oat straw, namely: 5 lbs. of bran, 3lbs. of oats, 2 lbs. of corn and 2 lbs. of oil meal. This with what oat straw she will eat will make a fairly good ration, but not the best.

HOW MUCH CORN?

In *Orange Judd Farmer*, Dec. 25, page 662, F. W. Woll: "Four to five pounds corn may be considered a maximum allowance per head, daily, for cows, and many cows will put on fat on this allowance." Seven pounds is the amount often named in your paper with, say, nineteen pounds alfalfa. Can cows do their best on four or five pounds corn meal and as much alfalfa as they will eat? I am feeding seven pounds with cut feed, alfalfa, and to cows giving thirty to forty pounds of milk per day, I am feeding ten pounds meal. Am I feeding too much corn? A. M. H.

Dona Ana, N. M.

We do not know just what conditions Professor Woll may have had in mind when he wrote the above, but it is fair to presume that he was writing for conditions usual in the northwestern central states where alfalfa does not constitute any considerable part of roughage. No man can lay down an

arbitrary rule as to the amount of feed, no matter what its description, that shall be given to a cow; in other words, each cow has an individuality of her own, and should be fed accordingly. When one is feeding alfalfa hay and corn, he may be well satisfied that he is not using too much corn, so long as his cows make good use of it and do not lay on too much flesh. If the cow stores up superfluous body fat, one may be sure he is feeding too much corn, but as long as she is using this corn to make milk, he may be satisfied that he is not overstepping the limits of careful and profitable feeding.

SOJA BEANS AND FLAX SEED MEAL FOR COWS.

D. S., Bern, Kansas, writes that he has a lot of Soja beans, also flax meal and corn and oats. For rough feed his cows have the run of a stalk field which is supplemented with oat straw and millet hay. Bran can be had for $13 per ton. He asks "How shall I feed to get best results?"

We apprehend that D. S. would hardly be satisfied if we did not indulge in a little pleasant scolding about that stalk field. For a farmer to have a stalk field and let his cows run in it and expect to get much profit from them, would be like a banker doing business and charging nothing for exchange or interest. The foundations of all legitimate fortunes, whether large or small, whether counted by hundreds of dollars, or thousands of dollars, or millions of dollars, were made out of the accumulation of small savings.

It is a waste of labor and a waste of land and a waste of produce to try to cultivate more land than a man can cultivate properly, and harvest the crop. The stalks on an acre of corn, even in Kansas where all coarse fodder is so cheap, would more than pay for the expense incident to raising and harvesting the entire crop. Better cultivate fewer acres and secure the entire crop, and then have stock enough on the farm to consume all the coarse fodder and thus return to the land some of the fertility which has been taken from it to grow the crop. From a clipping which we published last week from a Minnesota paper we should think there might be quite a profitable market for this flax seed even in Kansas, and as it is hardly necessary to feed this in combination with Soja beans, we omit it in the formula which we submit as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. millet hay	9.23	.45	5.17	.13
6 lbs. straw	5.45	.07	2.32	.05
2 lbs. Soja beans	1.78	.59	.45	.29
8 lbs. bran	7.05	1.00	3.09	24
Totals	23.51	2.11	11.03	.71

As will be seen we have omitted to take into account anything received by the cows from the stalk field. As a matter of fact it will cost these cows about as much to gather this fodder from the field as it is worth to them; but on extra pleasant days there is perhaps no good reason why they should not be allowed to range in the field. If it is a stormy day or there is a cold wind blowing or it is unpleasant for the owner of the cows to be out of doors without a coat, his cows better be out of the stalk field.

A SOUTH DAKOTA RATION.

Please formulate me a balanced ration. I have well eared corn stover, sheaf oats (cut in the dough), well cured millet hay, corn and oats. Can buy good prairie hay at $2 a ton. Millet is worth $2 a ton; corn, 20 cents; oats, 18 cents; bran, (fresh from the mill) $8; oil meal, $22 to $25. We have plenty of corn and oats, millet, corn stover and sheaf oats; the other feed I can buy.

Amboy, Sanborn Co., S. D. E. E. S.

Oats at 18 cents a bushel come to $11.25 per ton and therefore cannot be profitably fed when good bran can be bought for $8.00. There is not very much choice in the coarse forage, but having the sheaf oats and stover and millet hay we should not care to go to the expense and labor of exchanging for prairie hay, although in some respects we consider the prairie hay the more valuable feed. If these cows have not been in milk too long, we think it would pay to feed them about 8 lbs. of bran, 2 or 3 lbs. of ground corn and 1 lb. of oil meal each twenty-four hours and then give them all the coarse forage they will care to eat.

Here is a case where it will richly pay to commence at once to keep a record of what each cow does. Weigh the milk at every milking, make a record of it, keep an account and determine which of the cows are worth keeping. Some of these cows will be found to have sufficient dairy ability to warrant giving them more feed; others will be unable to pay for their feed even when it is as cheap as it is in our friend's vicinity. It may be well to increase the allowance even to these poor cows and let them fatten, and then dispose of them. There is often much more net profit from one good cow than from two ordinary cows, just as there is more profit from one acre of good soil well tilled than from two acres of inferior soil, poorly cared for.

TWO WISCONSIN RATIONS.

Please formulate a balanced ration out of corn ensilage, oats and bran. Also for another party out of oats, rye, timothy and cut corn fodder. Does it pay to grind oats and rye, paying for the grinding, or feed whole? Are cows liable to injure themselves by eating too much ensilage?

Pine River, Wis. H. E. F. & SONS.

Answering the last question first, we have to say that we do not know that there is any more liability to injury by eating too much ensilage than there is in eating too much of anything else. It does not follow, however, that we consider silage a complete food, or as furnishing, when fed alone, the most healthful or the most profitable roughage. The cow herself is the best judge in such cases, and the fact that when fed silage she seems to have a craving for some dry fodder is an indication that her system needs it. Good straw, good corn stover, hay, and especially clover hay, should be supplied in addition to silage, and in such quantities as the cow will eat with relish.

We can, however, make a very good theoretical formula from the feeds named, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
50 lbs. silage	13.20	.65	7.00	.35
8 lbs. bran	7.05	1.00	3.09	.24
6 lbs. oats	5.34	.55	2.84	.25
Totals	25.59	2.20	13.93	.74

It is simply impossible to make a satisfactory formula for the second party. The best that can be done is to suggest 10 lbs. timothy hay, 10 lbs. corn fodder, 6 lbs. oats and 6 lbs. of rye. The oats may be fed without grinding, although we think, as a rule, it is better to grind them, but we would not think of feeding unground rye.

A MARYLAND FEEDING QUESTION.

Please give me a balanced ration for my cows, 13 in number, if my feed is not what my cows need. I am feeding 40 lbs. of good, sweet silage; 16 lbs hay; 4 lbs. oat chop and bran mixed, and 2 measures of Baum's stock food, daily. My silage is poor field corn. I suppose would have made 6 barrels corn per acre, owing to the dry season. I have a round silo, 14×28; silage kept good. Let me hear from you what will be better for my cows to get all that is in them.

Double Pipe Creek, Md. J. D. D.

If J. D. D. had indicated what kind of hay he was feeding his cows, we would be much better enabled to express an opinion as to whether they were receiving as much grain as they could profitably use; 40 lbs. of silage, 16 lbs of clover hay, 4 lbs. of oat chop and bran mixed would make a very fair ration for cows that have been giving milk six months or more, and were expected to freshen again next spring. With timothy hay this allowance would be altogether too small, and the amount of grain should be at least doubled. We make no account of the "two measures of Baum's Stock Food." We presume this so-called measure is a little tin cup, holding, possibly a gill, and that feed referred to is one of the condimental foods upon the market, which may have more or less value as a stimulant to the appetite, and possibly an aid to digestion, but with a nutritive value entirely out of proportion to the cost of the feed. We should suppose that in Maryland one might obtain a first-class quality of cotton seed meal; and that the addition of 1 or 2 lbs. of this meal to the daily allowance would result in a very considerable profit.

AN INDIANA RATION.

Will you please formulate for me a ration from the following materials: Good clover hay; ground corn, $14; corn and oat chop, the same; wheat bran, $15; can get oil meal, if necessary. Have four cows, one will be fresh in February, the other three not until June and September. Cows are grade Jerseys. D. E. H.

Winchester, Ind.

Give the fresh cow substantially the following daily allowance, feeding one-half at night, and the remainder in the morning:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs clover	16.94	1.36	7.16	.34
4 lbs corn and oat chop	3.56	.34	2.08	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	24.02	2.20	10.78	.63

If the cows are accustomed to noon feeding, give them a little something to eat, so that they may not be disappointed and fretting all the afternoon.

A MINNESOTA RATION.

A. H. D., Harmony, Minnesota, is feeding his cows 4 lbs. bran, 6 lbs. succotash (wheat and oats, 40 lbs. to the bushel), 10 lbs. mangels and what hay (mixed timothy and clover) they will eat up clean. Assuming that his cows eat 20 lbs. of this hay, we figure the ration as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17.16	.96	7.92	.32
10 lbs. mangels	.91	.11	.54	.01
4 lbs. bran	3.52	.50	1.54	.12
6 lbs. succotash	5.36	.59	3.66	.16
Totals	26.95	2.16	13.66	.61

As his cows are grade Jerseys weighing from 800 to 1200 lbs., we apprehend the above will not be far out of the way as an average. This opinion is corroborated by his statement that he is having very good success, which he attributes in a very considerable degree to the instructions received through the DAIRYMAN.

We incline to the opinion that if the succotash could be sold so as to buy an equal amount of bran the appearance of the formula would be improved, and it is quite possible that the resulting yield from the cows would show some improvement also.

A NEW YORK RATION.

Will you make me a balanced ration that is the cheapest, from the following:

Bran, $17.00; middlings, $18.00; corn meal, $18.00; cotton seed meal, $25.00; oil meal, $26.00.

Feed corn stalks which have been shredded, and some straw mixed with them.

Also have turnips. Will it do to feed some of them and how many?

Have a separator and make butter, and sell to customers at 25 cents the year round.

Jacks Reef, N. Y. C. McI.

We specify turnips in the formula which follows, on the theory that if fed to cows immediately after milking and after the milk has been removed from the stable there will be little or no tainting of the milk at the next milking. We have received this assurance personally and by letter from a great many of our friends and correspondents. We have never had occasion in our own experience to feed turnips to milch cows, and therefore cannot speak with personal knowledge concerning them. If our correspondent finds that in feeding turnips there is no injury to the quality of his butter he will of course continue to use the turnips. On the other hand, if they still continue to taint the milk, notwithstanding they are fed as above directed, their use better be discontinued; unless indeed he wants to take the trouble of "washing" his cream. When this process was suggested some years ago by the DAIRYMAN it occasioned a good deal of hilarity among some of our overwise contemporaries, but there was here and there a progressive dairyman who was willing to try new things, and found that washing the cream was not only a possible process but a very useful one in some emergencies, and especially in localities where garlic and wild onions abound. This process consists in first separating the cream from the milk and then diluting this cream with two or three times its bulk of warm water and re-separating. If the water is raised to 150° or 160° F. it in effect pasteurizes the cream, and it may be necessary to use a "starter" afterward. With these reservations we suggest the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. stover	14.38	.43	8.10	.20
20 lbs. turnips	1.90	.20	1.44	.04
6 lbs bran	5.29	.75	2.32	.18
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	23.41	2.12	12.20	.59

A WISCONSIN RATION.

Please send me a ration for cows from the following:

Corn fodder; clover hay, $5; timothy hay, $6; oats, per bushel, 22 cents; corn, per bushel, 30 cents; wheat bran, $16. I have oil meal. Weight of cows, 900 pounds.

Warrens, Wis. W. H. G.

With clover hay at $5 per ton, we should be disposed to use it quite liberally as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover	12.70	1.02	5.37	.26
5 lbs. stover	2.98	.09	1.62	.04
5 lbs. oats	4.45	.46	2.37	.21
5 lbs. corn	4.45	.45	3.34	.22
Totals	24.58	1.97	12.70	.73

If the oil meal on hand is sufficient for the purpose, we would drop out 1 lb. of the corn and 1 lb. of the oats, and add 2 lbs. of the oil meal.

A WISCONSIN RATION.

H. A. M., Valley, Wisconsin, has been in the dairy business about fifteen months, and has had very gratifying success, which he attributes in a large measure to the influence of the DAIRYMAN. He now asks us to formulate a ration for him from bran, $15.00; shorts, $15.00, ground oats, $14.50; and corn meal, $12.50. For roughage he has early cut mixed hay, good, bright corn stover and oat straw. He has also a few mangels. For cows fresh in milk we suggest the following as the minimum daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. hay	8.53	.48	3.96	.16
10 lbs. stover	5.95	.17	3.24	.07
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. oats	4.45	.46	2.37	.21
1 lb. oil meal	.91	.29	.33	.07
Totals	24.25	2.03	11.83	.66

For cows that have ability to pay for their feed, as good dairy cows should, another pound of oil meal might be added to the allowance above specified, especially after the mangels are fed out.

A VERMONT RATION.

R. E. K., Newport Center, Vermont, sends us $1.10 to renew his subscription for the DAIRYMAN and secure the *Farm Journal* for one year. This is not a bad combination. The *Farm Journal*, although some-

what diminutive in size and still more so in price, is really a very valuable addition to the reading matter in a farmer's home.

R. E. K. can purchase bran at $20 per ton; gluten meal and cotton seed meal at $25; corn meal at $18; oats at 35 cents per bushel. He has a ton of bran and one hundred bushels of barley which he wants to use. For roughage he feeds clover and timothy hay once a day, and oat straw once. Some of his cows are fresh, and still more are to become fresh before grass grows, and he asks us to give him a formula for a ration, which we do as follows, with the remark that the amounts given are for cows in fairly full flow of milk. Those that have passed their maximum yield and are rapidly approaching the period of freshening again, should of course receive much less. Those that have a capacity of yielding 25 or 30 lbs. of milk per day should receive more. There are no rules that can be laid down for feeding cows or any other farm stock that will dispense with the intelligent judgment of the feeder. In trying this formula, therefore, due regard should be had to the condition and ability of the several cows, giving some more and some less:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. hay	8.53	.48	3.96	.16
8 lbs. straw	7.26	.10	3.09	.06
2 lbs. barley	1 78	.17	1.31	.03
2 lbs. cotton seed meal	1.84	.74	.34	.17
5 lbs. bran	4.41	.63	1.93	.15
Totals	23.82	2.12	10.63	.57

A KANSAS DAIRYMAN SUBMITS A RATION FORMULA.

H. C. W., of Garnett, Kansas, sends his renewal for the DAIRYMAN with the comment that he would be at a great loss without it, as, in addition to general farming, he keeps a few Jersey cows for the profit there is in it. Before taking the DAIRYMAN he fed his cows plenty of hay and corn stover and some corn. Since taking he has changed his plans by buying bran, oil meal and cottan seed meal and says he has found quite a saving in feed and a large increase in flow of milk. At the present time he is feeding according to the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
10 lbs. mixed hay	8.53	.48	3.96	.16
3 lbs. corn and cob meal	2.67	.19	1.89	.10½
2 lbs bran	1.76	.25	.74	.06
1 lb. oil meal	.91	.29	.33	.07
1 lb. cotton seed meal	97	.37	.18	.08½
Totals	23.31	2.26	10.68	.65

We do not see how this formula can be improved, more especially if he keeps a record of the amount of milk produced by each cow and increases or decreases the grain allowance as the cows seem to make good use of it.

ABORTION IN YOUNG STOCK—SPOTTED BUTTER.

Will a heifer with an abortion at first calf ever make a good cow?

What is the cause of spotted butter?

Rock Island, Ill. J. E.

Abortion can take place for several years in succession without injury to the value of the cow for future use.

It may be due to small specks of dried cream, from coagulated casein, not broken up in the churn, or from irregular distribution of salt in the butter.

HEATING MILK WAGONS.

Can you inform us of any device for heating milk wagons? S. B.

Colorado Springs, Colo.

We have seen milk wagons heated by means of a small stove placed in front of the driver, but do not know of any special device used for this purpose.

AN ONTARIO RATION.

I have eighty tons ensilage (corn well eared and nearly mature); ten tons mixed timothy and clover hay; abundance of oat and wheat straw; 150 bushels mixed peas and oats of 1:2 ratio (bulk); bran at $13 per ton; peas, 60 cents per bushel; oats, 28 cents per bushel. Please fix me a ration from them for fresh cows and heifers of 500 to 800 pounds weight. Hay is worth $8 to $10. Can get gluten feed at about $24. Oil cake is plenty but, I hear, high—probably $25 to $28.

I have figured a ration for myself, but want to know how you would do it, as I may be wrong. IMPROVER.

Ingersoll, Ontario.

With bran selling at $13 per ton, we cannot recommend the feeding of peas and oats at $20 per ton, notwithstanding the latter may have been raised on the farm. We should much prefer to sell the grain at the prices named, and invest the proceeds in bran. If this cannot be done, we would recommend the following for trial:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
5 lbs. hay	4.27	.28	1.98	.08
5 lbs. straw	4.54	06	2.03	.02
8 lbs. bran	7.05	1.00	3.09	.24
4 lbs. oats and peas	3.56	.52	2.00	.10
Totals	27 34	2.25	13.30	.65

The figures given in the above formula for bran and oats and peas fully justify what we have said above as to their relative values.

It is also possible that the smaller cows will refuse to consume so much dry matter. In that event we would reduce the hay and straw somewhat, and substitute two pounds of gluten or oil meal for four pounds of bran or the oats and peas.

A PROMISING WISCONSIN CONDITION.

P. C. E., Scandinavia, Wis., who reports himself as a young reader of the DAIRYMAN, thinks if we could give him some directions for feeding his cows it would not only help him, but a whole lot of "trying-to-do-the-right-thing farmers." He owns seventy-two acres of land, of which sixty is under the plow, and he has only eleven cows and heifers. Although he is one of the owners and patron of a creamery in Waupaca county, his receipis for the year were less than $300, and he rightly concludes that the DAIRYMAN would comment on this as being too small a lot of cows, and too small an income. But he signs himself "Yours for prosperity and progress," and we are not at all concerned but what our next report of him will show a decided advance.

The first thing for him to do is to get a spring balance, a very cheap one, that he can buy at any hardware store, will answer fairly well, and then weigh the milk of each cow at every milking and make a record of it. This practice will, undoubtedly, reduce the number of his cows, but if it does it will assuredly increase his profits, and profits are the legitimate end and aim of keeping cows.

He has an octagon silo, twelve feet in diameter and twenty feet high, filled last fall to the brim with good, well-eared, early Dent corn, and he has lots of clover and timothy hay, besides the usual straw stack. Oats are worth 22 cents a bushel; bran, $14 a ton; and oil meal, $1.15 per hundred. The following combination of these feeds will make him a good ration for good cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.53	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
4 lbs oats	3.56	.37	1.89	.17
2 lbs. oil meal	1.82	.59	.65	.14
Totals	25.35	2.33	12.24	.80

We think it altogether likely that if 3 lbs. more of bran were added in place of the 4 lbs. of oats specified, the ration would give equal results, and perhaps better.

A UTAH RATION.

Will you please make me a ration from the following: alfalfa, mangels and chop wheat? Which would be the better, chop wheat or wheat bran at $12 per ton each?

Cache Co., Utah. H. M. R., JR.

The following combination presents a very fair average daily allowance for a herd of milch cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. alfalfa hay	18.32	2.20	7.92	.24
20 lbs. mangels	1.81	.22	1.08	.01
8 lbs. bran	7.05	1.00	3.09	.24
Totals	27.19	3.42	12.09	.50

Of course the digestible protein here is much larger than is really necessary, but protein is not an expensive feed where alfalfa hay is cheap. We should much prefer corn chop or corn and cob meal to bran for feeding with alfalfa, and this would decrease the protein, somewhat, and increase the fat, and it is for a similar reason that we prefer bran to chop wheat. Bran carries 3 per cent of fat, where chop wheat carries only 1.7.

AN OHIO RATION.

Am feeding a herd of Jerseys; product (cream) sold in Cleveland. Would you kindly formulate me a balanced ration out of the following feeds: Ensilage (corn), ground oats, bran, and gluten feed, and all the timothy hay they will eat. Also, one with oil meal, old process. FEEDER.

Painesville, Ohio.

Comparing the formula which follows with others which are published from time to time, wherein clover hay is available in place of timothy hay, ought to serve to teach this inquirer and a good many others the value of studying the question of raising proper feeds for milch cows. There is probably more money lost by the utterly unreasonable practice, among farmers, of growing timothy hay to the exclusion of other fodder crops than in almost any other mistake they make. It should be remembered that protein is the one essential and indispensible element in feeds for producing milk, and that there is almost three times as much protein in 100 lbs. of clover as there is in 100 lbs. of timothy hay.

Under the circumstances given, we can do no better than recommend the following as a fair average daily allowance for a herd of milch cows, without regard to whether their product is to be disposed of as milk, cream or butter:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
8 lbs. timothy hay	6.94	.22	3.47	.11
3 lbs. roots	2.67	.28	1.42	.13
3 lbs. bran	2.64	.38	1.16	.09
5 lbs. gluten feed	4.61	1.02	2.42	.18
Totals	24.78	2.29	12.67	.72

AN OHIO RATION.

Will you form me a balanced ration for my Jersey cows out of the following feeds: First-class timothy and red top hay, half and half, $10 per ton; corn stover of best quality, $14; oats, $20; can buy bran for $18; gluten feed, $18; oil meal, $30; don't know price of cotton seed meal. Cows have been in milk a year and a half and are making 35 lbs. of butter per week—one heifer and five mature cows. Their feed at present is 8 lbs. of corn and oat chop at the rate of 2 of corn to one of oats, 15 lbs. of hay, 10 lbs. of stover. Cows are not with calf yet, and I want to feed them for most net profit. My corn is richer in protein than the analysis given on page 754 of the DAIRYMAN. The grain shows fully one-half protein, or gluten. E. J.

East Palestine, Ohio.

Cows that have been giving milk for a year and a half and are now yielding nearly a pound of butter each per day, must be pretty good cows, and must have had and are still receiving pretty good care. We have very much questioned whether anything could be gained by exchanging the feed to which these cows have become accustomed, although they are now receiving considerably less protein than the standards call for. On the other hand, if these cows were fresh in milk or nearly so, we are quite of the opinion that 4 lbs. of gluten feed would be better for them than the mixture of corn and oats as now fed.

While we cannot say that our correspondent's conclusion in regard to his corn may not be correct, we think it more than likely that his eye has not been able to discriminate carefully between the gluten and starch.

A WASHINGTON RATION.

Please give us two formulas for cheapest and best rations for butter cows, one with and the other without roots.

Price of produce: Bran, $17.50; shorts, $18.50; middlings, $25; oil meal, $35; hay timothy and a little clover mixed, $15; oat hay, $15. Our roots are mangels and carrots, not mixed, and worth $8 per ton. We have all, except mill feeds, ourselves. I might state that good butter retails at 35 cents per lb. We have two grades of bran, light and heavy, which is the better for us? D. & B.

Fairhaven, Wash.

The situation above outlined is practically similar to that submitted by our friend from Metchosin, British Columbia, and the answer on page 933 will serve as an answer to the first of the above inquires. When feeding the roots, the oil meal may be omitted; when the roots are gone, substitute from 1 to 2 lbs. of oil meal as the indications may war-

"Uneasy Lies the Head That Wears a Crown."

But such are not the only uneasy heads. Overworked housewives, harassed business men, anxious teachers, ambitious students—all ages and both sexes are uneasy with aches, pains, impure blood, disordered stomachs, deranged kidneys and liver. For all such, Hood's Sarsaparilla is the effective and faultless cure. It infuses fresh life and health into all parts of the body through purified, vitalized and enriched blood. Try it.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Scrofula and Consumption

People tainted with scrofula very often develop consumption. Anemia, running of the ear, scaly eruptions, imperfect digestion, and enlargement and breaking down of the glands of the neck, are some of the more prominent of scrofula symptoms—are forerunners of consumption. These conditions can be arrested, consumption prevented and health restored by the early use of

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

rant. The light, flaky bran is much superior to the heavier, as it contains a larger proportion of protein.

FEEDING BUTTERMILK TO HOGS.

1. Will good results be got by feeding pigs on buttermilk alone?

2. Should the buttermilk be fed fresh from the churn, or kept sometime, if so, how long?

3. Is it advisable to feed pigs whey the same day as buttermilk? J. T. Finlay.

Queenstown, Cape Colony, S. Africa.

Buttermilk has a feeding value, equal to skim milk and can be fed to pigs with good results, provided that the proper amount of grain be given along with it. Three pounds of buttermilk to one pound of corn meal will be found to give the best results so far as gain in weight and feeding value of the buttermilk is considered.

The fresher the buttermilk is fed the better; delay in keeping only lessens its feeding value and long delay is liable to cause scours, etc., when fed.

It will be all right to feed whey the same day as buttermilk, but it must be remembered that whey is low in protein content and consequently the grain fed with it must contain more protein than when buttermilk is fed. A mixture of corn and middlings, equal parts, makes a good grain ration to go with whey.

A MISSOURI RATION.

Will you formulate ration for my cows, mostly fresh and weigh 1,000 lbs. I have millet hay, medium ripe, oat straw and timothy, threshed and unthreshed; bran is $14; corn meal, $11; cotton seed meal, $30; and linseed, $35. Also give our neighbor a ration, who has access to same feed, except he has good timothy only. J. K M.

Vandalia, Mo.

This is a case where one feels very much tempted to scold. Over ripe millet hay and medium ripe oat straw and timothy hay, threshed and unthreshed, do not make a satisfactory forage for any class of stock, and least of all for milch cows. We cannot hazard an estimate as to the digestible nutrients contained in such forage, and we, therefore, give the formula for J. K. M.'s neighbor as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. timothy hay	17.36	.56	8 68	.28
6 lbs. bran	5.29	.75	2.32	18
2 lbs corn	1.78	.16	1.33	.09
2 lbs. cotton seed meal	1.84	'74	.34	.17
Totals	26.27	2.21	12.67	72

J. K. M. can follow this formula, substituting such forage as he has for the timothy hay, and we advise both him and his neighbor to look around and make some inquiries and see if they cannot buy cotton seed meal for considerable less than the price named. It ought to sell almost anywhere in Missouri for not to exceed $25 per ton, and in many places for less than that.

MIDDLINGS.

A dairy woman in Lancaster, Massachusetts, asks whether middlings are a suitable ration for dairy cows.

The terms "middlings" and "shorts" are used very interchangeably. Genuine middlings, as will be seen by reference to our table on page 754, rate a little higher in feed value than bran, Shorts, on the other hand, which have, in recent years especially, come to be practially ground over bran with all the sweepings and dirt and weed seeds of the mill added, are a very unsatisfactory feed, and possibly rate much lower than the figures in our table would seem to indicate. Genuine middlings, as the term implies, would be that part of the wheat between the fine flour and the bran and would be composed of the finer particles of the bran and some of the coarser, floury particles of the wheat. This product is practically unknown in the modern roller flouring mills.

It follows from the above that genuine middlings would be a good feed for dairy cows, but they should be mixed with bran or ground oats or something of that kind for best results, not only to lighten them up or distend them, but also to obviate the "stickiness" which results when they are fed by themselves.

A MICHIGAN RATION.

Please fix me an economical ration for grade Jerseys about 800 or 900 lbs. weight, from the following: Corn silage, not too plentiful; cut corn stover, good and bright; peas and oat hay, cut green; gluten feed, $18.20 per ton here; bran, $15.00 per ton here; corn, 35 cents per bushel (do my own grinding); oats, 28 cents per bushel (do my own grinding); to include part or all of the above and to get the best possible returns.

Hudsonville, Mich. Wm. W.

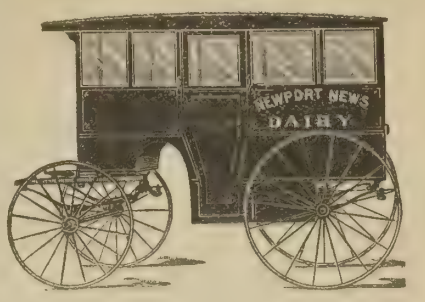
If we are to use some of all the feeds above named we do not know that we can do better than suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	14
10 lbs. straw	5.95	.17	3.24	.07
5 lbs hay	4.27	.46	1.84	.06
2 lbs. corn	1.78	.16	1.33	.09
2 lbs. oats	1.78	.18	.95	.08
3 lbs. bran	2.64	.38	1.16	.09
3 lbs. gluten feed	2.77	.61	1.45	.11
Totals	24.47	2.22	12.77	.64

THE CHEMISTRY OF BUTTER FAT.

In a recent number of the *Journal* of the American Chemical Society appeared the last of a series of contributions from the laboratory of the Pennslyvania Experiment Station upon the subject of "The Chemistry of Butter Fat," written by Mr. C. A. Brown, Jr., Assistant Chemist.

They represented a large amount of careful work in the study of the composition of butter fat and of the changes which pure butter fat undergoes in turning rancid. This investigation shows clearly that, instead of butter containing, as commonly stated, a large proportion of stearic acid, the prominent fatty acid of beef suet and lard, it contains only about 2%.



It was also found that even in fresh butters the oleic acid, whose corresponding fat forms the chief liquid element of all animal fats, has undergone some oxidization. A pure butter fat becomes rancid, the olein is decomposed and both the oleic acid and glycerol formed from it are oxidized. It has long been recognized that the increase of acid in butter is not a true measure of its rancidity, the taste and smell being a better means of judgment than chemical reagents. It was found that the acidity did not increase rapidly until long after decomposition had set in and also that, contrary to the commonly accepted belief, the disagreeable odors are not due to the decomposition of butyrin, the characteristic fat distinguishing butter from other animal fats.

In consideration of the above definition of butter fat it is pertinent to ask where are those hired chemists of the oleo combine who declare that oleomargarine and butter are the same in the work of digestion. The fact is that butter, in the process of digestion is utterly unlike any other fat in existence. It is the only fat designed by nature, which in its raw natural state can be taken up and digested in the stomach of the most tender infant. If butter fat and oleo are identical, try feeding the latter to a human infant or the infant offspring of any of the animal creation. Sickness and disease will soon follow. Those learned judges who gravely declare that oleomargarine is just as wholesome as butter, have never considered the original purposes of nature for which butter fat is designed. Correlative with its use in the health and growth of the young, stands its relation to the well being of the adult portion of the human race. It would be just as reasonable to suppose we can find an artificial milk that is just as good as natural milk, for the purposes of digestion as it is to expect artificial butter fat or casein, or milk sugar or any of the other natural elements of milk.

This assertion of the wholesomeness of oleomargarine, supposing it to be pure, is born of the selfish purpose of the olemargarine manufacturers and favoring judges and other defenders and are but echoes of this dangerous selfishness.

But when we add to this danger of a false statement the other fact that any counterfeiter of food will not scruple to adulterate even the adulteration if he can make money by it, we can see where the public are placed when they resign themselves to the ender mercies of such swindlers.

THE VALUE TO THE DAIRYMAN OF A GOOD HEART.

The man who would deal successfully with animal life must cultivate within him a good heart for it is from the heart that "the mouth speaketh." Ward C. White, the famous Wisconsin dairyman, who uttered the phrase which has since gone round the earth, "I always speak to a cow as I would to a lady," posessed a face in which shone the reflected light of a good heart, and his kindness was exhibited to his neighbors as well as to his cows. It was forty years ago, that he demonstrated the practical *value* of his kindness, by making a herd of seventy cows of native stock, yield on an average over 6000 lbs. of milk per. cow, from which he made 600 lbs. of cheese per cow.

That good saint, of the Catholic church, Thomas a Kempis understood this great law for he says:

"If indeed thy heart were right, then would every creature be to thee a mirror of life and holy doctrine."

It is extremely difficult to get a great many men to see that the reason why they are not financially successful with cows, is because they treat them in so heartless a manner. They tie them up in rigid stanchions and force them to bare their young in such cruel confinement; they compel them to lie in their own filth until their sides are plastered with it; they shut them up in dark, damp underground stables, forcing them to breath air reeking with poisoned fumes; they half starve them in winter's cold and midsummer drouths; they dog them and abuse them with blows and curses. All these things are of common practice and then such men wonder that this wonderful mother denies to them a profit from her motherhood.

A good heart will prompt a man from out its own wisdom to a better treatment of the cow. Many men lack good hearts.

Congress and the People.

ED. HOARD'S DAIRYMAN:—There is much written upon the subject of this great counterfeit, oleo. It seems to be the universal opinion of those that have given the subject careful consideration, that the government should raise the tax to 10 cents. The manufacturers would then derive more profit than the dairymen would.

The only method in my way of thinking, to bring Congress to do justice by the dairyman and every other citizen of our great country, is for each and everyone to write to their congressman to right this great injustice that the farmers are laboring under. Let each and every member of the grange, all that have an interest in pure and unadulterated food and each dairyman, interest himself and get all his friends interested in deluging Congress with their letters. Then if they refuse to listen to us we can elect those that will, as we have the power to do it. If you will start the ball by advocating this, keeping it in standing head lines, advising all other papers to do likewise, this session of Congress will not adjourn without passing the bill. We want no compromise in the matter. H. F. GUELD.

Kenduskeag, Me.

Questions from a New Subscriber.

ED. HOARD'S DAIRYMAN:—I received the first number of my subscription to the DAIRYMAN last week. Am very well pleased, and find it very interesting all the way through. Had I sent in my subscription just one year ago, and asked you to give me a balanced ration, and other information of importance to new beginners, am not slow to say that I might be a few hundred dollars ahead financially, and a great deal wiser and better equipped for my business. I did a great deal of figuring for a formula for daily ration, and finally got to a place where I got as I thought pretty good results for the money, and waded in, changing feeds occasionally, making it more palatable for the cows. For roughage, I feed 10 lbs. millet hay, and 10 lbs. corn fodder, cut in the proper time, and put under roof before snow falls, all bundled and in first-class condition, all raised on the farm, and at market value as follows: Millet, $8.00 per ton; corn fodder, 10 cents per shock, 12 hills square or $4.00 to $4.50 per ton; and for grain, corn and cob meal 6 lbs. at $6.00 per ton; 5 lbs. bran at $15 00 per ton; 1 lb. oil meal at $30.00 per ton. This is my stand-by ration. Can get gluten meal at $20.00 per ton; gluten feed at $15.00 per ton; Quaker chop at $18.00 per ton; brewers grains, kiln dried malt, at $15.00 per ton. Please formulate a ration from above named feeds, from all or a part as you think best; average weight of cows, 1,200 lbs. I forgot to say I added a tablespoonful salt per cow to every feed, and soaked with hot water and fed warm, all winter.

I should like to see an analysis of millet hay, and why more dairymen do not raise and feed it. I want to grow some alfalfa next season, but it is entirely new here, and

CAREME 4th's PAULINE, H. F. H. B., 33247.

Property of KARLEN & Co., Monticello, Wis.

Two Wagons at One Price.

It is a matter of great convienience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel Wheels, with either direct or stagger spokes, with broad faced tire, are made to fit any axle. You can convert your old wagon to a low, handy wagon in a few moments time. You thus virtually have two wagons at one price. Write to the Electric Wheel Co., Box 1130 Quincy, Illinois, for their catalogue, which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers, etc.

Watch Your Kidneys.

The Most Important Organs in the Human Body--They Throw Out All Disease.

Swamp-Root Cures Weak Kidneys.

Does your back ache?

Do you have pains across your kidneys?

Is your complexion chalky, gray, white?

Is your skin dry or feverish? Are there puffy bags beneath your eyes?

Are your eyes dull, listless and dead looking?

Are you irritable and hard to please?

Do you feel as though you have heart trouble?

Do you have to urinate several times in the night? Is there ever a scalding, burning sensation there?

Do you feel the desire immediately to urinate again, with no result?

Is your urin clouded, thick or milky?

Is there any sediment or do particles float in it?

Don't neglect these conditions, and if they or any part of them are yours, Swamp-Root, the great kidney remedy will be found just the medicine you need.

Here's a simple test for the kidneys, just as certain as though a physician were in personal attendance on your case: Pour some of your "morning" urine in a glass or bottle and allow it to stand twenty-four hours. Then hold it up to the light, and if you find any settlings or sediment, or if it is thick or milky, or if small particles float about in it, don't hesitate for a moment, but write at once to Dr. Kilmer & Co., mention HOARD'S DAIRYMAN, and immediately begin using the sample of Swamp Root which you will receive at once, absolu ely free by mail. The results will surprise you.

Swamp-Root is purely vegetable, pleasant to take, and is for sale by druggists everywhere in bottles of two sizes and two prices —fifty cents and one-dollar. Bear in mind the name, Swamp-Root, and the address, Binghampton, N. Y.

if some experienced growers will tell us through the columns of the DAIRYMAN, when and how to prepare the soil, when and how to sow, and when and how many times to reap, they will greatly oblige a new beginner. As to preparing feeds, I think the most important question to dairymen is being overlooked and should be talked of more through the columns of our great teacher, the DAIRYMAN, and that is this: Steam cooked, boiled, or dry, which? Whole grains and cut fodders steam cooked or boiled, or ground grains and cut fodders, raw and dry, which?

Wishing the DAIRYMAN success, I wait for reply. G. W. H.

Linden Heights, Ohio.

Most of the questions submitted by this subscriber have been discussed to a greater or less extent in recent issues of the DAIRYMAN, and therefore must be briefly treated of here. The ration he is now feeding ought to produce, as it does, very good results, but we are of the opinion that it will be somewhat improved by changing the bran for gluten feed. The gluten feed, if of good quality, is worth more by a very considerable percentage than bran. If we were to submit a "standby," it would be:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs millet hay	9.23	.45	5.17	.13
10 lbs. corn fodder	7.10	.37	4.04	.12
6 lbs. corn and cob meal	5.34	.28	3.78	.21
5 lbs. gluten feed	4.61	1.02	2.42	.18
1 lb, oil meal	.91	.29	.17	.07
Totals	27.19	2.41	15.58	.71

This is a pretty large ration, and it ought to be ample for the large cows kept by our correspondent. Brewers grains might be substituted in part for the gluten feed or fed interchangeably with it.

We will pass on the inquiry about seeding alfalfa to those "experienced growers" from whom the information is sought. The experience of the editors goes back only to last spring, and while the results were very encouraging, they do not enable us to speak with so much positiveness as we may be able to use later on.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 10,620 pounds, and the entire offering was sold, 4,500 pounds at 29 cents, 6,120 pounds at 28½ cents. The market was reported firm at 29 cents, an advance of one cent.

The sales reported were:

Factory.	Pounds.	Price.
Fort Atkinson	1,500	28½c.
Aztalan	1,320	29
Ayrshire	1,200	29
Red Clover	1,620	28½
Stone's Corners	1,080	29
Mayfield	900	29
Huntley	3,000	28½
Total	10,620	

The markets for the corresponding week of the three preceding years were as follows:

Jan. 9, '99, 3,060 lbs. of butter sold at 20½c.
Jan. 10, '98, 9,600 lbs. of butter sold at 20c.
Jan. 11, '97, 34,980 lbs. of butter sold at 19@19½c.

The New York market Monday was reported steady at 30 cents. H. C. B.

Elgin, Ill., Jan. 8, 1900.

DAIRY MARKETS.

ELGIN, Ill., Jan. 8—Butter advanced 2c on the Board of Trade to-day. All of the offerings, 177 tubs, were sold: 102 tubs at 28½c and 75 tubs at 29c. Official market firm at 29c; one year ago butter sold for 20½c; sales reported for the week, 9,600 tubs.

CHICAGO, Ill., Jan. 8—Butter—Firm. Creamery extra, 29c; cold storage creameries, 25@27c; firsts, 27@28c; seconds, 22@24c; imitation creameries, fresh, from unsalted butter, 18@22c; dairies, extra (Cooley's) 25c; firsts, 22@24c; seconds, 20c; ladles, 17@17½c; roll, 17@18½c.

Cheese—Firm. Full Cream Cheddars, 11¾@13c per lb.; Twins, 11¾@12½c; Young Americas, 12@12½c; Swiss, 12¼@13c; Limburger, 11½c; Brick, 11c.

Eggs—Steady. Strictly fresh, per doz., cases returned, loss off, 20c; held stock, 12@15c; icehouse, 7@12c; seconds, $1.75@3 per case; checks, $2.40 per case.

Bran—Scarce and quotable at $12.25@12.50 per ton.

Cattle—The few "good" beef cattle offered sold steady, but general market was weak, with average prices about 15c lower. Some of the "pretty good" cattle sold only 5@10c lower, while the "betwixt and between" kind sold 25c lower in many instances. Five loads of 1,309-lb. Shorthorn steers sold at $6.55, with $6.45 the next highest. Only about a dozen loads sold above $6.25, with thin 1,041-lb. steers at $4, and the bulk of 1,150@1,400-lb. steers at $5@$5.85. Corn-fed Westerns sold at $4.50@6, bulk, $5.60@5.80. About 700 straight Texas steers averaging 861@1,180 lbs. sold 10c lower at $4.25@4.95. Native butcher stock declined 10@15c, with the bulk of sales at $2 60@3.25 for cows, $3.65@4.25 for heifers, $3.25@4 for bulls, $4.10@4.65 for stags, and $6.25@7.25 for calves. 31 1,318-lb. Short-horn cows sold at $4.65, with a load of fancy 1,230-lb. heifers at $5. Feeding cattle were firm at $3.25@4.75.

To-day's receipts are estimated at 3,500 cattle, 38,000 hogs and 17,000 sheep.

NEW YORK, Jan. 8—Butter—Creamery, Western, extras, 30c; creamery, firsts, 28@29c: state extras, 29@30c; state firsts, 27½@28½c.

Cheese—State, full cream, large or small, fall made, fancy, 12¾@13c.

Eggs—State, Pennsylvania and Western, 23@24c.

BALTIMORE, Md., Jan. 8—Butter—Market firm; creamery separator extra, 30c; extra first, 28@29c; creamery first, 27@28c; creamery, imitation extra, 25@26c; Iowa and Northwestern ladle, extra, 24@25c; ladle, extra first, 22@23c; first, 20@21c; Western store-packed, 20@21c; creamery rolls, (2 lbs.), 30@31c.

Eggs—Market easy; strictly fresh stock, 20c.

PHILADELPHIA, Pa., Jan. 8—Butter—Solid-packed separator creamery, extra, 29@30c; creamery, firsts, 28½c; seconds, 25@27c; imitation creamery, extras, 25c; firsts, 22@23c; seconds, 20c; ladle-packed, extra, 22@23c; firsts, 21c; seconds, 18c. Print butter, creamery, extra, 30c; firsts 29c; seconds, 25@28c.

Eggs—Pennsylvania and nearby, 19@20c; Western, 19@20c; Southwestern, 19c; Southern, 18c.

ST. LOUIS, Mo., Jan. 8—Butter—Steady; creamery, 24@28c; dairy, 19@24c.

Eggs—Steady, 17½c.

KANSAS CITY, Mo., Jan. 8—Butter—Creamery, 21@24c; dairy, 17c.

Eggs—Fresh, 17c.

CINCINNATI, O., Jan. 8—Butter—Firm; 28c.

Eggs—Easier; lower, 18c.

Cheese—Steady; good to prime Ohio flat, 12½c.

BOSTON, Mass., Jan. 8—Butter—Market excited; 30c quick.

Cheese—Market steady, 13c.

Eggs—In better shape than last week, 14@26c.

NEW ORLEANS, La., Jan. 8—Butter market quite firm, 28@29c; fancy ladles, 20c.

Eggs—Storage eggs nominal.

WASHINGTON, D. C., Jan. 8—Butter—Market firm. Extras, 29c; choice, firsts, 27c; fancy imitations, 23@24c. June creameries, 26c.

NEWARK, N. J., Jan. 8—Butter—Market firm; 30c for western extras. Fair receipts.

NEW YORK MARRET.

NEW YORK, Jan 6—Butter—Receipts for the week, 24,938 packages. Exports for the week none.

Receipts of fine fresh creamery butter continue light, and buyers have found it difficult to find quality good enough to suit their trade. The price for extra fresh creamery was 28c on Monday advanced to 29c through the middle of the week, and wound up on Friday at 30c bid, and not stock enough to go around. The scarcity of extras compelled most of the buyers to take the next best quality, and firsts were quickly taken at 28@29c; fresh imitation creamery are wanted at 25@26c; fresh ladles are in better supply and show less improvement than anything on the list; sales ranging from 20 to 23 cents for good to very finest.

The few tubs of fine, fresh dairy butter here, this week, sold at 27@29c, and fair to good qualities found buyers at 22@25c. June make creamery out of refrigerators sold at 26@27½c for the best, and 22@25c for poor to good lots. Our market is strong at the close, and unless receipts are increased, prices may be further advanced during the coming week. We quote:

Creamery, fresh, extra, 30c; medium, 27@29c; poor, 24@26c. Creamery, summer make, extra, 27@28c; medium, 25@26c; poor, 20@23c. Dairy, extra, 28@29c; medium, 25@27c; poor, 20@22c; Ladle, extra, 22@23c; medium, 19@20c; poor, 15@17c.

Cheese—Receipts for the week, 11,923 boxes. Exports for the week, 4,141 boxes.

There is no change since last week. Trade continues dull, but holders of fine cheese claim to have confidence that trade and prices will both be better later on. Exporters took few lots of skims at 6@9c. We quote:

Full cream, large, extra, 12¼@12½c; medium 11@11½c; poor, 10@10½c. Full Cream, small, extra, 12¾@13c; medium, 11½@12c; poor, 10@11c. Part Skimmed, extra, 10½@11c; medium, 8@9c; poor, 5@7c. Skimmed cheese, poor, 5@7c.

Eggs—Receipts for the week, 31,157 cases. We note a little improvement in fine fresh stock and better price; but for all other grades the market continues demoralized and prices nominal. We quote: New York & Penn., strictly fresh, per doz., 26@27c; Western & Northern, strictly fresh, 22@24c; all sections, so called fresh, 16@20c; refrigerator stock, 12@15c; Limed eggs, 14@15c.

177 Chambers St. DAVID W. LEWIS & Co.

Latest quotations for fancy creamery: Buffalo, 30c; St. Paul, 25½c; Minneapolis, 25½c; Detroit, 29c.

LIVERPOOL, Jan. 8—Butter—Finest United States, 95s; good, 75s.

Cheese—American finest white, 57s; American finest colored, 59s.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Position by all round dairyman, also good butter and cheese maker (Hollander), 4 in family, all good milkers. Will work on shares or by the month. J. HEKKELMAN, New Bavaria, Ohio.

For Sale—In Outagamie Co., ¾ acre of rich land, with cheese factory and equipped for making American and brick cheese. Good water in factory. Run 3,500 lbs. milk. Good shipping facilities. For sale cheap; part payment down, balance on time. Address N. A. NELSON. Weyauwega, Wis.

For Sale—One 3,000-lb. Russian Imperial Separator. As good as new. A bargain for some one, Address, FRANK YOUNGS, Birmingham, Mich. 47-3

"The Salt That's ALL Salt."

Is a title denoting unequaled purity.

THE University of Wisconsin

Has analyzed the leading dairy salts of all countries, and given the results in a special bulletin which shows that

Diamond Crystal Salt

is the only salt in the world above 99 per cent. pure.

OUR RIGHT TO USE THE TITLE MUST REMAIN UNCHALLENGED.

DIAMOND CRYSTAL SALT COMPANY,
ST. CLAIR, MICH.

For Sale—Pure bred Tamworth pigs ready to wean. Also a few Holstein bull calves. GLIEDT & KAISER. Freistatt, Mo. 48-6

Wanted—To rent, a creamery in a good locality with a good run of milk. Prefer one fully equipped. Address LOCK BOX 45, Lake Mills, Wis. 48-4

Wanted—Experienced man to help care for our herd of selected Holsteins. Must be first-class milker, reliable, temperate and intelligent. Address, with references and wages wanted by the year. DELLHURST FARMS, Mentor, Ohio 48-3

For Sale—One large Turbine De Laval separator and two twin cream vats, capacity 200 gals. each. Are in good condition. Address, LANCASTER CREAMERY CO., Lancaster, Pa. 48-4

Guernsey Calves For Sale—Best blood of two Exp. Sta. tests. BLACK & BROS., Mt. Vernon, Ind. 48-3

Wanted Now—A strong, able and sober married or single man to work by the year on farm in Illinois. Must be good milker. For further particulars address A. J. DAUGHERITY, Streator, Ill. 46-tf

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman. 44-tf

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

Wanted a position by an experienced butter and cheese maker. Student of Cornell Dairy School. Best of references from late employer. Address EDGAR BARNES, Linwood, N. Y. 44-tf

Four choice O. J. C. boars for sale; stock direct from L. B. Silver Co., originators of O. J. C. swine. G. L. BURLESON, Sumner, Wis. 45-tf

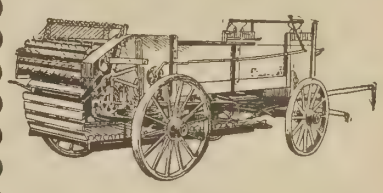
Wanted—A creamery or cheese factory in good location in Wisconsin. Will buy or lease. Must have from 3,000 to 5 000 lbs. milk daily and sufficient to run year ronnd. Address No. 5, care Hoard's Dairyman.

Having rented my farm, I offer for sale 10 full blood Holstein cows and heifers and 5 full blood calves. Also breeding bull, 2 years old, whose 15 nearest ancestors have records of more than 26 lbs. butter in 7 days. Full particulars will be given. Address, WM. HAMBLY, Belmont, Wis. 48-2

For Sale at a Bargain—22 milch cows, 10 heifers with calf; all grade Jerseys out of a good dairy strain. Also milk wagon and milk route of 80 qt. per day. HICKORY GROVE DAIRY, Decatur, Mich.

To Let—Sub-divisions of Prairie Farm, 160, 200, 300 and 400 acres, 16 miles from Toledo Separator Creamery. Silos and special butter customers. These are first-class farms, stocked with first-class cows, and none but first-class dairymen need apply. State experience and resources in application. Address, E. L. LOCKWOOD, Petersburg, Mich. 47-tf

For Sale—Dairy and outfit. Terms easy. R. A. LAMBERT & SON, Mobile, Ala. 46-tf



For Sale at a bargain, a creamery, feed mill and water power in one of the best farming districts in state of Wisconsin. For full particulars address BOX 640, Marshfield, Wis. 46-3

Buttermaker of 9 years' experience wants a steady position. Married. Will furnish good references. Work guaranteed. State wages. Address J. R., care HOARD'S DAIRYMAN. 46-tf

Grand Excursion to Old Mexico—Via Chicago & North-Western Railway, to leave Chicago Tuesday, January 30, 1900, under personal direction of Mr. J. Grafton, an experienced excursion manager. Entire trip in special train with dining car. Tour is arranged to include Mardi Gras at New Orleans and all principal points of interest in old Mexico and ticket covers all expenses. Only limited number can be accommodated; secure space early. For descriptive pamphlets and information, call on, or write agents Chicago & North-Western R'y. 47-4

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis. 38-tf

Tour of Puerto Rico.—The American Tourist Association announces two tours of the beautiful island of Puerto Rico under escort of Mr. Walter Boyd Townsend, the well-known artist and traveler, through and around the Island by rail, carriage, automobile and boat. Special Pullman Cars leave Chicago Thursday, February 15, and Thursday, March 8, at 12, noon, connecting with the splendid new steamships Ponce and San Juan sailing from New York second day following. Tickets include all expenses everywhere. All railway, steamer and sleeping-car fares, meals and berths on steamers, meals on dining car, hotel bills in New York and Puerto Rico, all transfers, carriage rides in the cities and through the Island, guides and interpreters are included in the tickets. There are no extras. Tours are under the direction of Reau Campbell, General Manager, A. T. A., 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to the Agents of the Chicago, Milwaukee & St. Paul R'y. 48-sp

It Chews Manure

of all kinds into fine or coarse bits; sows it thick or thin; makes it go thrice as far.

Second-Hand SEPARATORS

I have on hand a lot of cream separators in good order that I will sell cheap for cash. Second-hand Sharples Factory and Dairy Separators; also De Laval Standard, Alpha and Baby Separators of almost all sizes. Also second-hand separators of other makes. Write for prices and particulars.

P. O. BOX 56, WEST CHESTER, PA.

A New Book for Stockmen—Proceedings of Guernsey Breeders Ass'n.—1884–'99. It is of value to all breeders of dairy cattle gives practical experience of many prominent men on breeding and feeding problems, treatment of diseases, etc.; numerous valuable essays on special topics. $1 post paid. W. B. HARVEY, Sec'y, West Grove, Pa.

FINE CREAMERY PLANT FOR RENT On the most advantageous terms to the right party; built new two years ago, equipped with two separators and full line of up-to-date machinery. Will rent with privilege of purchase at end of year. Creamery less than half mile from $500,000 beet sugar refinery where beet pulp is given away. Will stand strictest investigation; now owned by co operative company. Do not write unless you can command sufficient capital to operate the plant successfully and can furnish A 1 references. Address, C. O THOMAS, Secretary, Caro Elgin Butter Company, Caro, Mich.

A Tioga County, (New York,) Dairyman.

ED. HOARD'S DAIRYMAN:—"Riverview Farm" is another of Owego's great dairy farms. It is the property of Mr. Edward H. Miller, and is an historic spot, having been, Mr. Miller informs me, granted by royal warrant to John Reedmond Coxe, in 1775, by King George III. In 1828, it was sold to Col. McCormic, and remained in his family until sold to Mr. Miller, his grandson, two years ago. During a period of 124 years, it has changed ownership but twice.

The original farm contains 90 acres, and is located at an elevation of 400 feet above the river, thus affording a fine view up and down, and which may be seen a long disdistance, each way, winding along its course to the sea. There are, however, two other farms, one of 80, the other of 150 acres, the latter lying near Gaskill, where most of the young stock is now kept.

There is a hill-side barn with basement on the home farm, where about 50 of the herd are kept, of which 30 are cows.

Mr. Miller was formerly a coal dealer in Owego, but sold his business to prevent the sacrifice of much of the value of this farm property, bought it, and began, what to him was an entirely new business, with which he is greatly pleased, and which he is determined to improve, i. e., dairy farming.

The 80 acre farm is known as the James Beers farm, and has accommodations for 100 head of stock, together with all approved modern appliances, which includes a large silo.

The milk is mostly peddled in Owego, and is carefully cared for before being delivered to customers. As soon as it is drawn from the cow it is taken to the milk room, where it is aerated, then cooled by passing it over a cylinder filled with ice. This operation removes animal heat and odors. It is then strained four times by different processes, after which the bottles or cans are placed in tanks of ice water, till ready for delivery to the customer, by Mr. Charles A. Ballow, who has driven over the route twice a day, during the last twelve years.

The surplus milk, if any, goes to the Standard Butter Company, where it is Babcocked, and sold on the basis of its butter fat content. There are four silos in all, with a capacity of 1,000 tons.

But I am going to allow Mr. Miller to tell the balance of the story in the form of an interview:

The firm, said he, is that of Miller & Mackey, myself being manager.

How large is the present herd, and what is the breed?

There are 55 now in milk, of which 19 are Holsteins and 8 Jerseys; balance are natives. We peddle most of the milk in Owego village.

What does the Babcock say about its per cent of fat?

We have not tested it, but the Standard Butter Company did sometime last summer, and reported 3.9 per cent.

How many acres of silage corn did you plant last year, and of what variety was it?

About 100 acres; the variety was Leaming and the yield about 1,000 tons.

Do you feed silage in summer? If so, have you ever received any complaint because of the milk being injured thereby?

We fed silage 365 days last year (beginning ten days earlier than usual.) No complaint whatever has ever reached us from our customers, because we feed silage. There is no reason why there should be, from the fact that, not only is the silage as good as can be grown and cured, but the grains we feed with it are also pure, and of the right kind to balance the silage.

Do you cross the Holsteins and Jerseys, or breed both separately?

Separately; having thoroughbred sires at the head of each herd. Our Holstein herd is headed by Shadeland Boon Czar, from the Powell Brothers' herd, whose dam has a record of 122½ lbs. of milk in 24 hours. Among the Holsteins are some very fine cows, of which I will mention Fyte 4th, Fyte 2d, Wandagelsche, Alamagelsche and Geletka.

The Jerseys are mostly stock from the E. L. Clarkson, Clearmont farm, on the Hudson, with the St. Lambert, Butter Bull 4th, at the head.

Do you make mostly summer or winter milk?

We aim to have cows coming fresh every month. This plan not only allows us to furnish the supply needed by our customers, but to supply a somewhat better quality of milk, by adding the new milk to that from cows long in gestation.

How long, as a rule, do you allow your cows to go dry?

About two months. Our endeavor is six weeks to two months.

What are the maximum and minimum yields of milk from the herd?

The average is 7,000 pounds; maximum, 12,000; minimum, about 4,000. But we are weeding out the low ones, which are mostly grades, and replacing them with thoroughbreds, both Holsteins and Jerseys, our aim being to mix quality with quantity.

So, then, you do not sell milk on its fat basis?

No, sir. We mix the milk of both herds, which gives us one of good enough quality to satisfy our customers, which we sell for four cents per quart in summer and five in winter.

How about the calves? What becomes of them?

We are now raising the best heifers, both thoroughbreds and grades. Do not make it a point to sell stock, except some bulls, for which we get good prices.

What do you feed with silage?

We had no clover last year, nor can we buy any. The drouth ruined it all in this locality. Our ration is silage, 40 to 45 pounds, with about 5 pounds of mixed hay. The grain ration is made up of 8 quarts of Quaker dairy feed and bran, one-third bran, two-thirds Quaker feed, with two pounds of gluten, all mixed.

That is a pretty strong nitrogenous ration. How much corn does your silage contain?

About 50 bushels of ears per acre, which, with the stalks and hay, we think balances the ration about right.

What do you consider the cost of keep per cow?

We never have figured that, because we have pastured in summer and we soil with peas and oats, besides feeding silage every day. We also grow some millet to follow the oats and peas. We will have ensilage enough, notwithstanding last year's drouth, to last till peas and oats are ready next summer.

What was the revenue from your cows last year, and what the average number in milk?

About 60 in milk, which returned us $6,000, or, say, $100 per cow. The cost of keep, as I said, we have not figured, but it was somewhere in the neighborhood of $45 per cow, which we hope to reduce somewhat hereafter.

How about the care of the cows in winter, and how are they watered?

We allow the cows to go out about one hour each day, in winter, when the weather is favorable, to drink and get exercise; but the water is all warmed by a steam jet, from a boiler in another building. The cows are never allowed to drink ice water, nor that very cold. I am, as I before remarked, just starting, therefore have kept no records of results arising from care and feeding; but it is my intention to keep carefully prepared ones hereafter, and be governed by them in future.

What do you do with the manure you make?

It is all drawn out every day and left in piles in the fields. We do not spread it at the time, but wait till spring. Possibly it were better to spread it directly from the wagon or sleigh, as very many dairymen recommend; but I am young in the business, having had no previous experience in farming, and all I know about dairy farming I got from HOARD'S DAIRYMAN. I had to 'get a hustle' on me to save property, and think I have met with a fair degree of success so far. But, if it had not been for the DAIRYMAN, I should have thrown up the sponge, quit, and remained in the coal business. But I am better satisfied than when I was in that business. I love to see the calves come and grow, and to watch the entire dairy work. I have been in several kinds of business, but like dairying best of all, and can see no reason why a man should not make dairying pay. I know that I can. But I have learned that one must start right, then stick to it; not quit in a year. As young as I am in it, and with as little experience as I have, I have had old stagers come to me for advice.

When our herd shall be all thoroughbreds, I hope to very much increase its yield, with no greater, if as much yearly cost. I am now negotiating with Mr. Clarkson, of Tivoli, on the Hudson, for 12 or 15 full blood, St. Lambert and Stoke Pogis Jerseys, which will replace as many grades. I find that it costs me no more to keep a cow worth $100, and which will earn me that amount each year than it does one that costs $35, but will not earn more than $30; or to breed a calf that is worth to raise or sell, when dropped, for $25, than one which is not worth raising, and will not sell for more than $1.50 for a 'bob.' By so improving the herd, we expect to get, not only more milk, but that richer in fat, and therefore a better price for it.

Belleville, N. Y. C. W. JENNINGS.

From Western Massachusetts.

ED. HOARD'S DAIRYMAN:—I have been a reader of HOARD'S DAIRYMAN for the last six or seven years, and it is the most practical, reliable and common sense, up-to-date dairy paper published.

I have been running a small dairy farm here among the Berkshire hills for the last six years. Am using the second silo built in western Massachusetts, built of stone and cement in 1880, and has been in constant use ever since. There were two 12×16×17, built side by side last season. The height was increased with single board matched spruce 16 feet, and the result was a perfect ensilage. My corn was Leaming, planted 3½ feet apart in drills, a stalk every 8 inches or as near as possible, with the result of a crop well eared and allowed to mature until partially glazed.

My cows never did better than this season. We are feeding about 45 pounds ensilage, 5 pounds hay and 6 to 8 pounds of Chicago gluten and bran, mixed by weight equal parts. Have about decided to add two pounds of cotton seed to the heaviest milkers. Our milk is bottled and sold in the neighboring city for 5 cents a quart at retail, and it is only the lack of confidence in each other of the peddlers, and about all of them raise their own milk, that we do not get six this winter. But there are no people on earth so distrustful of each other as the American farmers.

By the way, I wonder if any of your readers feed any apple pomace to milch cows. There has been fed on this farm for the last twenty years, all the pomace produced by a large mill, and there is good feeding value in it. I have fed some seasons as high as one-half bushel per cow, thirty pounds.

Immense quantities of good feed are annually dumped into creeks and allowed to go to waste.

It has been my good fortune the past month to visit some of the most noted stock farms in the east: Hood's Jerseys at Lowell, Mass., Bowditch's Guernseys at Farmingham, Mass.; Cutting's Guernseys at Pittsfield, Mass.; Morton's Guernseys at Rhinecliff, N. Y.; E. C. Brill's Holstein-Friesians at Poughquag, N. Y., and the Jersey herd of John B. Dutcher at Pawling, N. Y.

There are many good cows at all of these places, in fact, famous ones, and how any farmer could visit these farms and not get renewed enthusiasm, I cannot understand, and I think any farmer, who visits an up-to-date stock farm, even if he travels 100 or 200 miles is making an investment that will surely pay him. For even the farmer cannot come in contact with progressive men, without being helped some.

NEW 20th CENTURY

De LAVAL "ALPHA" Cream Separators

A week ago we announced the introduction of the NEW 20th CENTURY "Alpha" De Laval Separators. The new sizes, capacities and prices are as follows:

FACTORY or CREAMERY STYLES.

Standard "Hollow-Bowl" Belt-Power,	1,300 lbs.	$ 200.—
Standard "Hollow-Bowl" Steam-Turbine,	1,300 "	225.—
"Alpha" Acme Belt-Power,	1,750 "	350.—
"Alpha" Acme Steam-Turbine,	1,750 "	375.—
"Alpha" No. 1 Belt-Power,	3,000 "	500.—
"Alpha" No. 1 Steam-Turbine,	3,000 "	525.—
"Alpha" No. 2 Belt-Power,	4,500 "	750.—
"Alpha" No. 2 Steam-Turbine,	4,500 "	800.—

"BABY" or DAIRY STYLES.

"Hollow-Bowl" "Baby" No. 1,	150 lbs.	$ 50.—
"Alpha" Strap "Humming-Bird,"	175 "	50.—
"Alpha" Crank "Humming-Bird,"	225 "	65.—
"Alpha" Iron-Stool "Baby" No. 1,	325 "	100.—
"Alpha" Iron-Stool "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 3,	850 "	200.—
"Alpha" Dairy Steam Turbine,	850 "	225.—

Great as has been the previous superiority of the "Alpha" De Laval machines to other separators, the 20th CENTURY "Alpha" developments place them above the possibilities of attempted competition from anything else in the shape of a cream separator.

Mr. Wheaton's Canadian Dairy Notes.

The Past Year in Dairying.—Pasteurizing for Butter.—New Zealand Conditions.

ED. HOARD'S DAIRYMAN:—The year, that has just closed, has, in several respects, been a very remarkable one, so far as Canadian dairying is concerned. Prices for both butter and cheese have been exceptionally good, showing in the case of the latter, a steady advance from the beginning of the season. The total value of our dairy exports for the twelve months has not yet been published, but we are certain it will run much above that of any previous year. Many are figuring on about $20,000,000, as their value for 1899, and indications certainly point that way.

The total exports of cheese, from May 1st last to the end of the year will likely show an increase of a few thousand boxes, as compared with the same period for 1898; while the butter exports will show an increase of fully 150,000 packages. This increase in butter exports is not as large as was expected a few months ago, when an increase of nearly 200,000 packages was reached. The supply of milk at the factories fell off rapidly towards the end of the year, bringing the final increase far below what was expected.

This falling off in the milk supply, during the last four months is one of the features of the year's business. One of the most severe drouths this country has seen for years was experienced in many of the leading dairying districts of this province, resulting in a large falling off in the make, both of cheese and butter. So severe was it that many dairymen found it very difficult to increase the flow of milk, after the dry season was over.

In talking this matter over with a dairyman, recently, in Western Ontario, he stated that in the flush of the season, he had supplied 600 lbs. per day to the factory, but after the drouth had been on for a few weeks his daily supply had fallen to 150 lbs. This dairyman made a business of keeping cows, and to a large extent provided supplementary feed for them. If cows fell off so quickly in their flow of milk, under fairly good treatment, what must have been the shrinkage, where the pastures were not supplemented by green feed?

In sections similar to this, and we are sorry to say there were several of them last season, there is not much doing along the line of winter dairying. Dairymen find it hard to get food to keep their cows during the winter, let alone supplying milk to a winter creamery. For this reason, the output of winter creamery butter may not show much increase this season.

But while these unfavorable conditions have been prevalent in some sections, they have not generally prevailed. Many districts, especially those of Eastern Ontario and Quebec have had copious showers, all the season through, and are able to keep their winter creameries going full force. With prices for choice creamery, at from 21 to 22 cents, these should do a flourishing business. The local demand is excellent, and winter dairies are largely independent of the fluctuations of the export markets this season.

A word of warning might not be amiss here. There are many districts, in Ontario especially, that are more or less subject to a dry season, during July and August of each year. Why dairymen in these districts will neglect to provide supplementary feed for their cows to help them over the dry season is a mystery.

A little forethought in the spring, and an acre or two of ground sown with peas and oats, or some other green crop will go a long way towards overcoming the disastrous effects of these dry periods, and help to keep up the flow of milk for the fall months, when prices are the highest. If they cannot do this, they should plan to have their cows come in, in the fall, and make their off season during the dry time. This would perhaps be the safer plan to follow in any case.

One of the questions that is coming to the front here is pasteurizing. Our trade with Great Britain and the competition our butter meets with in that market makes a study of this subject a necessity. In catering to that trade we have to take cognizance of the requirements of the market and the kind of goods that best suit it. Of all the butter imported by Great Britain, the Danish leads in price and in position as to quality.

The Danish article is nearly all pasteurized which largely accounts for its uniformity in flavor and quality. If we are to successfully compete with Denmark in supplying the English consumer, we must give attention to this subject. If it is necessary for the Dane who lives so close to the market to pasteurize the milk or cream before it is made into butter, how much more important is it for us to do so, so far removed as we are from the market.

Pasteurizing seems to give to butter that mild, fine, clean flavor which suits the taste of the British consumer and if it is properly carried out will not injuriously effect the body of the butter, as some claim. This very mild flavor may not suit the home trade here which probably is the reason that pasteurizing has not been more generally adopted by our creameries. But it is the British market that we have to look to, to take the bulk of our products and we should endeavor to meet the needs of that market by adopting the methods of manufacture best suited to turning out the quality required.

With cold storage facilities on railway and ocean vessels, and cold chambers at central shipping points for storing the butter till it is forwarded, and with favorable climatic conditions, etc., there is no reason in the world why we in Canada should not turn out a quality of butter that would meet the wishes of the English consumer as well as the Danish article. The missing link in the chain of methods and practice, seems to be pasteurizing and the sooner our dairymen takes this matter up in a practical and systematic way, the better for the future of our export trade in butter. There is no time when it will do more good than the winter months, when our creameries are getting milk from cows fed in different ways and on different kinds of food.

In a recent issue of *Farming* Mr. J. A Ruddick, who went to New Zealand from Canada, in the fall of 1898, as dairy commissioner for that portion of Her Majesty's dominions, gives a very interesting account of dairying in that country. The expansion of the industry there is along the line of butter making rather than of cheese making, and it is in this particular that we may look upon New Zealand as a competitor in the British market. The climate and conditions there seem to be well adapted for carrying on dairying successfully, and with comparative ease to the dairyman. It is rarely necessary to house or provide feed for cattle during the winter, and about the only thing the dairyman has to do is to milk his cows and see that they have plenty of pasture.

There are two references in Mr. Ruddick's article that are well worth considering in relation to the industry here. He points out that the manufacture of butter is carried on in large central creameries, with a number of skimming stations attached. The industry is expanding, but it is along the line of increasing the number of skimming stations rather than the number of central creameries. By adopting this plan it is claimed that more uniformity of product can be secured and at a lesser cost than putting a butter making plant in each station.

This is the plan that was first advocated here when the winter dairying movement began, but our dairymen do not appear to have taken to it very kindly. There are a few concerns of this kind, such as at Renfrew and St. Marys, but the bulk of the creamery butter produced in this country is made in the factory where the milk is separated. The co-operative system has been pretty well developed with us, so far as the patrons of the individual creamery or cheese factory are concerned, but we are far behind our New Zealand kin in the co-operation of factories.

Another important point touched upon by Mr. Ruddick is the wages of the makers. In New Zealand the tendency is to advance the pay of competent men. No competent maker is ever turned adrift there because some

"I find them the best preparation for colds, coughs and asthma."—MRS. S. A. WATSON, Temperance Lecturer.

BROWN'S Bronchial Troches

OF BOSTON

Sold in boxes only—Avoid imitations.

350 Choice Brown and White Leghorn Young Hens For Sale at $1.50 each in lots of 25 or more. Bred from our prize winners in 4 states. Also **100 S. C. White Leghorn Cockerels** $2.50 each—good ones.
DELLHURST FARMS, Mentor, Ohio.

Jersey Bulls AND HEIFERS

out of large milking and tested dams, **FOR SALE.** W. R. THOMAS, Bellmore, Ind.

FOR SALE—For a short time we are offering A. J. C. C. **Jersey Bulls** from two to fourteen months old at **reduced prices.** They are from choice cows and are sired by St. Lambert of Brodhead 46957, one of the best of bulls, as his pedigree will show. We also have a few cows and heifers for sale. Write for catalogue.
N. N. PALMER & SON, Brodhead, Wis.

ALBION JERSEY HERD is headed by
Pedro's Prince Phillis 42298,
An **Ideal Dairy Sire,** carrying 75% of the blood of **PEDRO 3187.**
R. C. GREEN, Albion, Wis.

Registered Jerseys.
Herd headed by two of the best bulls in the state. No cows used for breeding that will not make 14 lbs. per week. Young bulls and heifers at reasonable prices. Address, J. F. EGERTON, Footville, Wis.

ST. OMER HERD Sons of General Signal and double grandsons of Exile of St. L., with 50 to 62½% of his blood, in exchange for good registered cows and heifers due to calve this fall.
JOS. T. HOOPES, Bynum, Md.

Your Own Price
For Three Bull Calves sired by three different bulls. St. Lambert, Pedro, and Combination blood.
GEO. A. BUCKSTAFF, Oshkosh, Wis.

BLACK EARTH JERSEY HERD
is headed by Diploma's Victor 56310; sire, Recorder 29239; dam, Nice 68027, full sister to Merry Maiden 64949. Young bulls for sale reasonable Address, FRED STUBLEY, Black Earth, Wis.

Hood Farm Jerseys **For Sale**—Inbred Combination Bull. Solid color. Dropped Jan. 2, 1899. By Mint, sire of 3 in 14 lb. list, a son of Diploma, sire of 51 in the list, out of a daughter of Combination. Dam, Tonnage Girl, test, 15 lbs. 1½ oz, with second calf, and milked 40 lbs.; won first prize in 2-year-old class, N. E. Fair, 1895; by Tonnage, a full brother of Transcept, 21 lbs. 8 oz. Write for price to HOOD FARM, Lowell, Mass

Brown Bessie Herd.
FOR SALE!
Three **BROWN BESSIE BULLS** fit for service. Highly bred, first-class individuals. Solid colors. Good opportunity to secure **"The Blood of The Winners."** Prices reasonable.
H. C. TAYLOR, Orfordville, Wis.

EUROTAS
Made more Jersey history than any other cow. In honoring the sires don't forget the dams. Some dams have brought forth sons; some milk; some butter. Eurotas had sons, great sires of great cows. Eurotas gave milk. Eurotas made butter; 778 pounds in a year. Write me for a pedigree of her grandson, Pedro of Fairfield.
W. F McSPARRAN,
Fairfield Stock Farms, Furniss, Pa.

Wisconsin Farmers' Institute Bulletin No. 13 now ready for distribution. No farmer should be without it. A 320-page hand-book of agriculture. Profusely illustrated. Treats of dairying, horses, sheep, swine, poultry, fruit, and all branches of farm work. Send for a copy. To Wisconsin farmers, 25c for cloth bound copy; 10c for paper covered copy. Outside of Wisconsin, 40c for cloth bound copy; 25c for paper covered copy. Address, Supt. GEO. MCKERROW, Madison, Wis.

Jersey, Guernsey Cattle
Chester White, Berkshire and Poland-China **SWINE,**
SHEEP, POULTRY, Hunting and House DOGS
50 Grand Grade Jersey Heifers to offer at once.

Introduce Fresh Island Blood Into Your Herd.
SIRES IN SERVICE:—The prize winning **IDA'S RIOTER OF ST. LAMBERT 10th,** the champion **CATONO KHEDIVE,** the champion **CZAR, COOMASSIE,** and **IMP. GOLDEN BAR,** inbred through his sire, Aristocrat, and his dam, Imp. Sandgate, to Golden Lad, the greatest bull on the Island of Jersey.
Write for what you want. Visitors always welcome. **JOHN E. ROBBINS,**
Greensburg, Ind.

PIGS Eligible to REGISTRY, and First Class Stock, at Reduced Prices. **Chester White, Berkshire, Poland-China and J. Reds. Thoroughbred and Grade Guernseys. Also Poultry. W. B. HARVEY, West Greve, Pa.**

A Top Pedigreed **POLAND CHINA SOW,** bred, $18.75; July pigs $7 to $10, none better. 12 years experience. S. HAWK, Mechanicsburg, Ohio.

fellow comes along who offers to make a few cents cheaper. Every maker is judged by the work he does, and if it is satisfactory, he is encouraged to remain by an increase in salary or some other recognition of his services. Very often if the season is a good one the maker receives a bonus over and above his salary by way of encouragement.

This is certainly the proper relation that should exist between the maker and his employer. If we had a little of it in this country it would be better for the industry. More good men would become makers and make it their life work. But as it is a man of ability can find better pay in some other calling where his services are more appreciated. As we have pointed out more than once, there is no calling where skill, intelligence and ability should receive greater recognition than in the making of butter and cheese.

The cutting down of the wages of makers and the discarding of a good man, because some fellow offers to do the work cheaper is one of the most serious difficulties connected with Canadian cheese and buttermaking at the present time. It is hard to say how far reaching its effects are. If a large manufacturing concern in any of our towns or cities metes out the same treatment to its skilled employees that many of our cheese factories and creameries do,it would soon go to the wall, and have to cease operations. Several of our best factories have during the last year or two, replaced skilled makers by cheaper men to their sorrow and it is to be hoped they have learned a valuable lesson that will serve as a warning to others.

The annual dairy conventions take place this month. The successful dairy year that has just closed should serve to increase the interest and attendance at these gatherings. Dairymen within reasonable distance of the places of meeting can hardly afford to miss these conventions. Though many of the same old dairy texts will be sermonized upon by many of the same old dairy preachers it will do one good to attend. The business is such a large one and so many new features coming up that no dairyman can hope to learn all there is to be learned about it, though he live through the twentieth century.

The Dairymen of Eastern Ontario will convene at Madoc, Ont., on January 9, 10 and 11, and those of Western Ontario at Stratford, on January 16, 17, and 18. The Cheese-and Buttermakers' will meet at Ingersoll, on January 31st and February 1st. We hope to be able to keep the readers of the DAIRYMAN informed as to what takes place at these gatherings.

J. W. WHEATON.

Toronto, Canada.

Feeding for Greatest Duration of Flow.

ED. HOARD'S DAIRYMAN:— Iam one of the one-cow dairymen,though a farmers boy, and interested in the business in its larger application. If the New England farmers could have known 50 years ago what you are teaching today it would have made millions of dollars difference in their wealth. One point of interest I have not yet seen covered by you. I want to feed for a fair supply of milk, for the longest period possible. Would it be better to begin with a maximum feed as soon as the cow will bear it, or to begin with a moderate feed of grain and then increase it to meet the shrinkage of the cow. S. D. D.

Northampton, Mass.

We do not know that the particular inquiry submitted by our correspondent has ever received careful attention and accurate trial We do know that many of the largest annual yields recorded have been made on moderate feeding, that is, moderate compared with the feeding given for a test of seven days. We cannot see that anything is made by not giving the cow practically all the feed she can comfortably dispose of early in the period of lactation The holding out in milk for successive months is not so much a question of what the cow has given previously or the amount of feed furnished her, as it is a question of individuality with the cow and the supplying of the feed requisite to enable her to keep up the flow. In other words there is no more reason why it should require less feed to produce a pound of milk in the second month of lactation than in the eighth month. Give the cow enough feed at all times and if she is a dairy cow she will respond up to the limit of her capacity. But if there is a lack of feed at any time, and the milk flow thereby checked, it is practically impossible to restore it.

Irregular Milking.

Some Well Recorded Facts Concerning Its Effect.

The Oregon Agricultural College and Experiment Station,a year or so ago instituted a series of experiments to know exactly what was the loss through irregular milking. In a certain loose way it has been a maxim with farmers since time immemorial that the cow could not maintain her average flow of milk if she was irregularly milked, but in this Oregon experiment we have the cold, frozen facts to guide us. That is, those *can* have them that will read them. Of course they are good for nothing to the man that thinks it don't pay to read.

The experiment was as follows:

Six cows were divided into two lots, such that the average age of the cows, and period of lactation, also total yield of milk was practically the same for each lot. The two lots received the same kind and amount of feed, but the cows in lot 1 were fed and milked regularly at 2:30 p. m. and 5:30 a. m., while those in lot 2 were fed and milked at hours ranging from 5 to 7 a. m. and 4 to 6 p. m. A comparison of the milk yield for three weeks, under this arrangement, with the three weeks preceding, showed that the cows in lot 1 made a gain in yield of 5.9 per cent, while those in lot 2 decreased in yield 4.4 per cent. Assuming that the cows in lot 2 would have done as well as those in lot 1 if they had the same treatment, which is highly probable, we find a loss of practically ten per cent in the milk yield during three weeks, due to irregularity in milking and feeding. The loss, however, was confined to the milk yield, as there was practicaliy no change in the quality of milk during the test period.

CONCERNING OUR ADVERTISERS.

Every person who owns horses or cows or pigs will be interested in the new catalogue of the Foos Manufacturing Company, of Springfield, Ohio, the makers of the famous line of Scientific Grinding Mills. The Scientific is one of the pioneer farm mills; it has proved so thoroughly reliable that nearly as many Scientific mills are in use on the farms of America as are all other makes combined. The catalogue, which is a handsome piece of printing fully described the entire line of these mills, showing their construction and points of superiority. They are adapted to grinding ear corn with the shucks on, cut fodder, hay and straw, and will also grind all other grains as well, making splendid feed for stock They are made for either horse or steam power, and have an enviable reputation for wearing qualities and ease of operation. The simplicity of their construction is one of their chief advantages, rendering them less liable to get out of order. We trust that our readers will send for this catalogue and examine the merits of these mills.

LARGEST SEED POTATO GROWERS IN THE WORLD.

The John A. Salzer Seed Co., LaCrosse, Wis., recently shipped twenty thousand bushels of seed potatoes to Alabama, Florida, Texas, and other southern points. The John A. Salzer Seed Co. is the largest grower of seed potatoes as also farm seeds in the world.

VITAL TO SEED BUYERS.

Mr. J. E. Northrop, author of "Seed Truth," is widely known throughout the country, not only as an experienced seedsman but as a gifted writer. Everyone who buys seeds should possess a copy of Mr. Northrup's latest work, entitled "Seed Truth," as it gives most valuable and unusual information regarding seeds and seed buying which no one can afford to neglect possessing and which is vital to the seed buyer's pocket book. Copies may be had free while the edition lasts, upon request, by writing Northrup, King & Co., Minneapolis, Minn.

BROMUS INERMIS.—6 TON HAY.

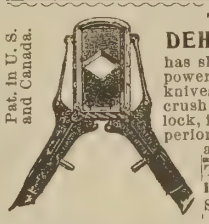
That sounds well—6 tons. That is what Salzer's Bromus will give you every time, no matter where you live; and Victoria Rape costs but 25c a lb to grow. The Million Dollar Potato is immense! Largest Vegetable Seed Growers in America. Send this notice with 10c for Farm Seed Samples and Catalogue, to John A. Salzer Seed Co,, LaCrosse, Wis.

The Fear of Humbug

Prevents Many People From Trying a Good Medicine.

Stomach troubles are so common and in most cases so obstinate to cure that people are apt to look with suspicion on any remedy claiming to be a radical, permanent cure for dyspepsia and indigestion. Many such pride themselves on their acuteness in never being humbugged, especially in medicines.

This fear of being humbugged can be carried too far, so far, in fact, that many people suffer for years with weak digestion rather than risk a little time and money in faithfully testing the claims made of a preparation so reliable and universally used as Stuart's Dyspepsia Tablets.



Now Stuart's Dyspepsia Tablets are vastly different in one important respect from ordinary proprietary medicines for the reason that they are not a secret patent medicine, no secret is made of their ingredients, but analysis shows them to contain the natural digestive ferments. pure aseptic pepsin, the digestive acids, Golden Seal, bismuth, hydrastis and nux. They are not cathartic, neither do they act powerfully on any organ, but they cure indigestion on the common sense plan of digesting the food eaten thoroughly before it has time to ferment, sour and cause the mischief. This is the only secret of their success.

Cathartic pills never have and never can cure indigestion and stomach troubles because they act entirely on the bowels, whereas the whole trouble is really in the stomach.

Stuart's Dysyepsia Tablets taken after meals digest the food. That is all there is to it. Food not digested or half digested is poison as it creates gas, acidity, headaches, palpitation of the heart, loss of flesh and appetite and many other troubles which are often called by some other name.

They are sold by druggists everywhere at 50 cents per package. Address F. A. Stuart Co., Marshall Mich., for little book on stomach diseases, sent free.

LATEST DEHORNER IMPROVED (Newton's Patent.) **Every Dehorner Guaranteed** THOUSANDS IN USE. Ask your hardware dealer for them or write H. H. BROWN MFG. CO.. - - DECATUR, ILL

Pat. in U. S. and Canada. General Rules Regarding the Conduct of Tests of Dairy Cows, University of Wisconsin, Agricultural Experiment Station.

The Agricultural Experiment Station of the University of Wisconsin, working in conjunction with the various Breeders Associations of America, will conduct official tests of registered cows during the year 1900, under the following conditions:

1. All tests will be conducted by the representative of the Station. Not less than two weeks' notice of the desired test shall be given by the owner, on a blank which will be furnished on application by the Station.

2. It is understood and agreed that the person for whom the test is made will pay all expenses in connection with the test. The compensation for the Station representative conducting the test, unless otherwise arranged, shall be $2.00 per day for each day of the test. The person for whom the test is made will also pay the necessary traveling expenses and provide for the accommodation of the Station representative while conducting the test.

The Station representative will present a bill of expenses to the owner of the cow or cows tested on completing the test, and will send a duplicate of the same, with his report, to the Station. This bill must be paid to the Station by the owner, before the report of the test is transmitted to the Association. The Station will pay the funds so received to its representative.

3. The Station will furnish its representative with the necessary apparatus to conduct the test. This will consist of

(1). A spring balance for weighing the milk.

(2). The Babcock test and accompanying complete apparatus for testing the milk.

(3). A 25 c. c. pipette for taking composite samples.

(4). A clinical thermometer.

(5). Blanks, affidavits, etc., for making the returns.

4. The Station representative shall fill out all blanks furnished by the Station as required, and shall make oath before a notary public to such statements as are required by the Station in conjunction with the authorities of the Associations.

5. If required, the Station representative shall make a report on the kinds and quantities of feed given during the test, and on the description and measurements of the cow or cows tested.

He shall take the body temperature of all cows tested, at least once a day during the test, preferably between two and three p. m.

6. The Station reserves the right to make public, in its reports and bulletins, or by other means, any and all findings secured while conducting official tests.

DIRECTIONS FOR STATION REPRESENTATIVE IN CONDUCTING TESTS OF DAIRY COWS.

1. The Station representative shall be present at the last regular milking preceding the beginning of the test, and shall satisfy himself that the cow is milked dry at that time. He shall note the hour at which this milking is made, and the final milking of the test must be made seven days later at the same hour.

2. He must be present at each and every milking during the test and satisfy himself that, at the close of each milking, the pail contains nothing but the milk drawn from the cow under test.

3. Under no circumstances can more cows than one undergoing test be milked at the same time. The Station representative must, in every case, be in position to observe the milker during the whole milking.

4. Immediately after the milk is drawn at each milking, he will take charge of the pail and contents, will weigh the same on scales provided by the Experiment Station, and enter the exact weight of milk at once on his records. He will then take a correct sample of the milk for his own tests and for the composite sample to be sent to the Station, in accordance with the following directions:

CONCERNING SAMPLING AND TESTING OF MILK.

5. As soon as the milk has been weighed it is thoroughly mixed by pouring it from one pail to another, or by means of a dipper, and a pint fruit jar is immediately filled about two-thirds full of milk for the test sample. The Station representative takes charge of and is personally responsible for this sample. It should be kept under lock and key until tested. The test is proceeded with as soon as convenient after the milk has cooled to ordinary room temperature.

6. Fat determinations are always made in duplicate, and the average of the two determinations recorded on the record sheet. The sample taken of any one milking is not thrown away until a perfectly satisfactory test of the milking has been obtained. The Station representative will enter at once the results obtained on the proper blanks, in ink or indelible pencil, on completion of each test.

7. If any of the milk, or the test sample from a milking is accidentally lost, the missing weight or the test credited to this milking is to be obtained by taking the average of all corresponding milkings during the whole test; that is, if, e. g., the evening milk is lost or the test sample therefrom, the average of the weights or tests of all evening milkings during the seven day test is taken as the yield or test for the one lost. It must be stated on the report that data so obtained are estimated and not actual.

8. Composite-test sample: At the time the test of the milk is made, a sample comprising as many cubic centimeters of milk as the number of pounds in the milking, is placed in a pint fruit jar containing a small quantity of preservative, for the composite-test sample to be sent to the Station, when the test is completed. A 50 cubic centimeter glass pipette for taking this sample is furnished in each outfit.

Each and every milking must contribute to the composite test sample, in the proportion to the amount of milk yielded each time, which will be accomplished by following the methods given.

The Station representative will be responsible for the proper care of the composite sample, and will send it by express, charges prepaid, immediately on the completion of the test, to Prof. F. W. Woll, Agricultural Experiment Station, Madison, Wis.

9. The Station representative is not at liberty to decide as to which stipulations contained herein are essential and which are not, but is required to observe these directions in all details. He shall report any irregularity or unusual occurrence in connection with the test which he may observe, and shall, in general, take all possible means to conduct a fair and equitable test of the cows placed under his supervision.

Feeding Value of Potates and Apples for the Dairy Cow.

ED. HOARD'S DAIRYMAN:—My attention has been called to the article of W. J. of our county, relative to feeding value of potatoes, apples, etc., for milch cows, in a recent number of your paper. From my own experience and also from observation of that of others I am led to fully concur with him as to the value, when properly and carefully fed, of apples as feed for all farm stock, and believe the surplus of this fruit to be worth much more for that purpose than can be realized from its manufacture into cider at the price for which that article usually sells.

Some years ago when residing upon the old farm where a large orchard, of what had formerly been nearly all top grafted trees but was becoming scrubby and run down, furnished a large amount of second rate fruit, not valuable for market, we made a practice each year to fatten one or more calves upon these windfalls and apples of inferior quality. We found it a comparatively

Eureka Harness Oil is the best preservative of new leather and the best renovator of old leather. It oils, softens, blackens and protects. Use

Eureka Harness Oil

on your best harness, your old harness, and your carriage top, and they will not only look better but wear longer. Sold everywhere in cans—all sizes from half pints to five gallons.

Made by STANDARD OIL CO.

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

A TRIUMPH OF SCIENCE.

To economical and up-to-date Butter Makers, the Best Color to use is the

ALDERNEY BUTTER COLOR

It contains all the requirements to make perfect butter and is declared by all who use it, as a triumph of science.

THE DIFFERENCE

between a force feed and a so-called "self feed" corn sheller is that the former never fails to deliver the corn to the picker wheels, no matter what condition the corn may be in.

LARGE CAPACITY. STRONG. DURABLE. CLEAN WORK.

THE... "NEW HERO"

is a force feed sheller. In addition it has every practical advantage essential to rapid and effective work. If you want a sheller, hand or force feed, 1, 2 or 4 hole, down or mounted, husker, ensilage or fodder cutter, shredder, wood saw, grinder, sweep power, tread power, wind mill, etc., we can furnish you the best. Our 160-page catalogue will convince you. It's free. APPLETON MFG. CO., 35 FARGO ST., BATAVIA, ILL.

GOOD CUTTERS, LOW PRICES.

This No. 11 Wolverine Feed Cutter represents unusual value at our price. Has extended knife shaft—pulley or fly wheel **may be placed on either side.** Like all our power cutters, it has hardened steel **4-edged cutting bar.** When one edge gets dull, simply turn the bar and you have **a new cutting edge.** Makes it **last 4 times as long** as the ordinary shear plate. 1¼ in. steel knife shaft; 11½ in. knives; big feed rollers and wide throat—**easy to feed;** pulleys 6, 8, 10, 12 or 14 in., as ordered; any length swivel carrier when ordered, extra; **delivers feed any height, any angle;** weighs 425 lbs.; cuts with 2 knives ½, 1, 1½ and 2 inches. **Price, $20.25.** Cuts with 4 knives ¼, ½, ¾ and 1 inch. **Price, $22.95.** Capacity for ensilage, 2 to 4 tons per hour; dry feed, 1 to 1½ tons per hour. **Trial given and satisfaction guaranteed on everything** we sell, or goods returned **at our expense and all money refunded.** Send for **free 336-page illustrated catalogue.** We have 53 sizes hand and power cutters and shredders. Marvin Smith Co., 55-57-59 N. Jefferson St., M-18 Chicago.

easy matter to take a late calf, say, one dropped from May 15th to June 10th, and after the flush of milk dropped off and the growth of swine farther reduced that supply, by feeding on these apples, beginning carefully and feeding a regular daily allowance according to the apparent capacity of the animals, to make them dress from 250 to 325 lbs. each by December or January.

Up to about October 1st, we fed them no grain, or none of any account, but after that would begin to supplement with light grain, feeding twice daily added to the dishwater from the kitchen and whatever milk there might be to spare the calves, usually a very limited amount.

We have also, in some seasons, fed apples quite largely to the swine with good results, and one season I particularly remember fattened one shote almost entirely upon apples with a small daily allowance of grain, during the late summer and autumn. But it was more especially with reference to the feeding value of potatoes that I began this article. I was quite surprised at the apparent low estimate which Mr. J. places upon them as feed for stock. Our own experience in their use for this purpose has led us to prize them quite highly as a supplementary feed, both for horses and for the dairy, in a raw state and when cooked and mixed with corn meal, or ground corn and oats, or buckwheat, for the fattening of swine, feeding poultry, etc.

I find many, who have tested the practice on quite an extended scale, agree with me on this point and believe that in a season when potatoes are very low, it is much more profitable to feed them out upon the farm than to cart them a considerable distance to market at the prices they will bring.

Among these was the late J. D. Smith, for many years so well known to readers of the DAIRYMAN as a careful investigator. I have often heard him say that when potatoes would bring only 25 to 30 cents per bushel delivered at the railroad, he was satisfied it paid him better to feed them out upon the farm. He was not quite certain that the actual nutritive value represented by a bushel of potatoes, would equal that amount, but was sure that, when fed to his dairy, either from the succulence furnished or from some chemical effect they produced upon the grain and other feed used in combination with them, he secured such results as paid him better than to sell the potatoes and buy grain at the usually prevailing prices of the latter.

The potatoes were of course fed uncooked to the dairy, but Mr. S. used to make a practice of boiling potatoes for feeding to his hogs and mixing with them while hot a sufficient amount of ground feed to make a pudding of considerable thickness, believing the scalding of the grain thus produced was a great advantage. One thing is certain that this feed produced excellent results in fattening of his swine.

And as farther evidence as to the value of potatoes for a supplementary feed for the dairy I would cite the experience of Mr. Emory Coe, of Hamden, who has, for many years, been quite an extensive potato grower though keeping a quite large dairy and depending mainly on that source for the income from his farm, located on what is known as Hamden Hill in one of the most elevated parts Delaware County. He, too, has made a practice in seasons when potatoes were unusually plenty and cheap of feeding them to his dairy, and as he believes with very profitable results.

Some five or six years ago—about the year 1893, I think it was—Mr. Coe had a very large potato crop and, on the occasion of a visit to his place the following spring, he told me he had fed during the winter to his dairy of some 25 cows, from which he was making butter, about 600 bushels of potatoes and believed they had netted him fully 25 to 30 cents per bushel, or as much or more fed right out upon his farm than he could have got for them by hauling some five or six miles to the railroad, for market.

I know, too, of many others who have made a practice of feeding them with similar results, so that, as I said at the beginning of this article both from my own experience and from observation, I would be disposed to advise the feeding of the surplus potatoes to the dairy if satisfactory prices for them cannot be obtained.

Of course some judg ment will be necessary in beginning carefully in feeding either apples or potatoes to properly regulate the amount given to each cow, but any farmer who is competent to have the care of a dairy, should be able to judiciously attend to that part and I believe they will find the potato crop can thus be sold at greater profit if they have the stock to which to feed them than to cart to market at 25 or even at 30 cents per bushel with the present prices for grain.

Delhi, N. Y. E. J. BROWNELL.

"Distribution of Nutrients in Corn Stalks."—Eating the Afterbirth.

ED. HOARD'S DAIRYMAN:—As you disclaim positive knowledge on this subject, I will volunteer such as I possess.

In the table of nutrients in Bulletin 149, of Michigan Agricultural Experiment Station, the composition of rough feeds is given as follows:

ROUGH FEEDS.	*Dry matter.*	*Protein.*	*Carbohydrates.*	*Fat.*	*Ratio.*
Green sweet corn...	.209	.01159	.12156	.0037	11.2
Leaves and husks....	.3046	.011	.1207	.0037	11.7
Stripped stalks.....	.239	.00305	.5479	.0037	53.4
Wheat straw.....	.914	.008	.379	.005	48.7

Now, Mr. Editor, when you ride past a pasture in time of severe drouth, and see the stripped stalks of succulent corn which have been rejected by hungry cows, it is evidence, not that the cow is a fool, but a chemist and not to be sucked in by simple succulence

I firmly believe that if we could know all about it, we would find that there is as strong physiological foundation for the almost universal appetite on the part of the cow, for her own afterbirth, as there is chemical reason for her almost universal disrelish for stripped corn stalks.

I suppose that those who abhor seeing the cow eat her own afterbirth, take it from her and feed it to the hog, and thus their æsthetic sensibilities suffer no violence.

W. C. HUNTINGTON, M. D.

Howell, Mich.

But the cow will eat corn stalk butts, when fed to her in silage or shredded, or otherwise properly prepared.

Canada Praises the Reid.

Canadian creamerymen and butter-makers sing the praises of the Reid Long Spindle Separator as loudly as do their brethren of the States. Here are extracts from letters recently received from some of the most successful creamerymen in Ontario:

W. A. HUTT, Esq., Aurora, Ont., says:

"*The Reid Improved Danish Separator bought by us has been in use since May 1st, and is giving excellent satisfaction. We are skimming from 3,300 to 3,500 lbs. per hour and the amount of fat left in the skim milk is about .02 of 1 per cent. We are well pleased with the machine and would recommend it to anyone intending to buy a Separator.*"

From WILLIAM PARKINSON, Jarvis, Ont.:

"*The Reid Improved Separator surpasses the guarantee in regard to capacity and clean skimming. I am skimming 4,000 lbs. per hour at a temperature of 160 degrees, down to .02. On Mondays I skim 4,5000 lbs. per hour, down to .05 and better. It leaves the cream perfectly smooth—neither whipped nor frothy—and will skim 16,000 lbs. or more without clogging. My opinion is, the Reid is perfect in every respect.*"

BRUSE BROS., Gormley, Ont., write:

"*The Reid Separator did not leave a trace of fat in the skim milk while separating 3,900 lbs. per hour.*"

From JAS. ELLIOT, Tilsonburg, Ont.:

"*The Reid Separator works excellently and gives the best of satisfaction.*"

JAS. SCOTT, Stirling, Ont., says:

"*We are well pleased with the outfit; the Separator skims perfectly.*"

The highest awards for creamery butter at Toronto, Canada, Sept. 8, 1899, went to users of the

REID LONG SPINDLE SEPARATOR

The following is an extract from the report printed by the *Toronto Globe:*

"In creamery butter, Mr. J. C. Bell, Winchelsea Creamery, Ont., who uses the celebrated Reid Separators and Pasteurizers, was awarded first and second prizes for the best butter produced. In the butter making contest, the cream used was shipped by W. A. Hutt, Aurora, who used the Reid Improved Separator and Reid Pasteurizer, and who also took first prizes at Winnipeg and St. John, N. B."

Official Tests of Holstein-Friesian Cows from July 1 to November 1, 1899.

These tests were made by Agricultural Colleges and Experiment Stations. The age is at the date of calving; the test is for seven consecutive days, commencing at the close of the day from calving; the fat is determined by the Babcock test, and the butter is estimated first at 80 per cent fat to a pound, the ratio employed at the World's Fair, initials W. F. M.; the second at 85 5-7 per cent fat, the method of the Agricultural Colleges, initials A. C. M.

Shadeland Amber 29330, 8 years, 2 months, 18 days; 30 days after calving; milk. 424.4 lbs., fat, 14.06 lbs., butter, by W. F. M., 17 lbs , 9.2 oz., by A. C. M., 16 lbs., 6.5 oz

Bontje P. 2d's Gerben 23958, 7 years, 2 months, 27 days; 51 days after calving; milk, 412 8 lbs., fat, 13 62 lbs., butter by W. F. M., 17 lbs., 0.4 oz., by A. C. M., 5 lbs., 14.2 oz.

Pauline Whitney 39946, 4 years, 5 months, 22 days; 3 days after calving; milk, 324 7 lbs., fat, 13.25 lbs., butter by W. F. M , 16 lbs., 8.9 oz, by A. C. M., 15 lbs., 7.3 oz.

Spring Brook Queen 700 W., 6 years, 2 months, 15 days; 11 days after calving; milk, 368.1 lbs., fat, 12.79 lbs., butter by W. F. M., 15 lbs., 15.7 oz., by A. C. M., 14 lbs., 14.7 oz.

Belle of Schillard 3d 19669, 9 years, 6 months, 11 days; 9 days after calving; milk, 384.9 lbs., fat, 12,57 lbs., butter by W. F. M., 15 lbs., 11.3 oz., by A. C. M., 14 lbs., 10.6 oz.

Dyllis 19817, 9 years, 10 months, 19 days; 21 days after calving; milk, 379.8 lbs., fat, 13.4 lbs., butter by W F. M., 16 lbs , 10 oz., by A. C. M., 15 lbs., 10.2 oz., net profit, $2 34.

Heilo 4th's Pet 43611, 3 years, 10 mouths, 25 days; 7 days after calving: milk, 331.1 lbs., fat, 11.01 lbs., butter by W. F. M., 13 lbs., 12.2 oz., by A. C. M., 12 lbs., 13.5 oz.

Ideal Hildegisela 40111, 3 years. 6 months, 8 days; 21 days after calving: milk, 372.5 lbs., fat 11.72 lbs., butter by W. F. M., 14 lbs., 10.5 oz., by A. C. M., 13 lbs., 10.8 oz.

Empress Koninghen 39461, 4 years, 4 months, 1 day; 50 days after calving; milk, 365.4 lbs., fat, 11.22 lbs., butter by W. F. M., 14 lbs., 0.4 oz., by A. C. M., 13 lbs., 1.4 oz.

Pleasant Valley Kate 2d 48432, 2 years, 3 months, 2 days; 21 days after calving; milk, 351.4 lbs., fat, 11.3 lbs., butter by W. F. M., 13 lbs., 12.6 oz., by A. C. M., 12 lbs., 10.5 oz.

Dorinda Jewel 2d 40931, 2 years, 10 months, 29 days; 4 days after calving; milk, 272 lbs., fat, 10.64 lbs., butter by W. F. M., 13 lbs., 4.8 oz., by A. C. M., 12 lbs., 6.6 oz ; net profit, $3.05.

Regis Princess of Wayne's DeKol 43870, 2 years, 4 months, 25 days: 70 days after calving; milk, 320.6 lbs., fat, 10.6 lbs,. butter by W. F. M., 13 lbs., 3.8 oz., by A. C. M., 12 lbs., 5.8 oz.

Belle Herbert's Jewel 2nd 898 W , 4 years, 26 days: 68 days after calving: milk, 381.3 lbs., fat. 10.62 lbs., butter by W. F. M., 13 lbs., 4.5 oz., by A. C. M , 12 lbs , 6.3 oz

Empress of Farm Home 45967, 2 years, 8 months, 29 days; 59 days after calving; milk, 374 3 lbs., fat, 9.74 lbs., butter by W. F. M., 12 lbs., 2.7 oz., by A. C. M., 11 lbs , 5.8 oz.

Clothilde Netherland De Kol 42917, 1 year, 9 months, 5 days: 17 days after calving; milk, 253 lbs., fat, 7.98 lbs., butter by W. F M , 9 lbs., 15.7 oz , by A. C. M , 9 lbs., 5 oz.

Rena C. Koningen 46172, 1 year, 10 months, 24 days; 2 days after calving; milk, 304 lbs., fat, 8.38 lbs., butter by W. F. M., 10 lbs. 7.5 oz., by A. C. M.. 9 lbs., 12.4 oz.

Bessie Ward Tritomia 44128, 2 years, 8 months, 5 days: 4 days after calving; milk, 245 lbs., fat, 8.57 lbs., butter by W. F. M., 10 lbs., 11.5 oz., by A. C. M.. 10 lbs.

Lost Wonder 41918, 3 years, 1 month, 5 days; 15 days after calving: milk, 312 lbs., fat, 9.57 lbs., butter by W. F. M., 11 lbs., 15.3 oz., by A. C. M., 11 lbs. 2.5 oz.

Pietertje Lady Wonder 438 9. 2 years, 1 month, 11 days; 31 days after calving; milk, 281 lbs., fat, 9 lbs , butter by W. F. M., 11 lbs., 3.8 oz., by A. C. M.. 10 lbs.. 8 oz.

Margolyn 2nd 40758, 3 years 8 months, 26 days; 29 days after calving; milk, 341 lbs., fat, 10 1 lbs., butter by W. F. M., 12 lbs., 9 9 oz., by A. C. M., 11 lbs., 12.4 oz.

Homestead Belle De Kol 42774, 2 years, 24 days; 21 days after calving; milk, 300 lbs., fat, 8 3 lbs., butter by W. F. M., 10 lbs., 5.9 oz , by A C. M., 9 lbs., 10.9 oz.

Bessie De Kol 2nd 42716, 1 year, 11 months, 13 days; 12 days after calving; milk, 227.6 lbs., fat, 8.08 lbs., butter by W, F. M., 10 lbs , 1.6 oz., by A. C. M , 9 lbs , 6.8 oz.

Aurora Boon 46426, 1 year 9 months, 29 days; 52 days after calving: milk, 253 lbs., fat, 7.5 lbs., butter by W. F. M., 9 lbs., 9.5 oz., by A. C. M., 8 lbs., 11.9 oz.

Cradock De Kol 44223, 1 year, 9 months, 26 days; 33 days after calving; milk. 226 2 lbs., fat, 7.52 lbs , butter by W. F. M., 9 lbs., 9.5 oz., by A. C. M., 8 lbs.. 12 3 oz

Summary—The average product of butter of cows, 5 years old or over, is 16 lbs., 9.3 oz., at 80 per cent fat, or 15 lbs., 8 oz. at 85 5-7 per cent fat; of those between 4 and 5 years is, 14 lbs , 9.9 oz. at 80 per cent fat, or 13 lbs., 10.3 oz., at 85 5-7 per cent fat; of those between 3 and 4 years old, 13 lbs., 4 oz. at 80 per cent fat, or 12 lbs., 5.8 oz. at 85 5-7 per cent fat; and of those under 3 years old, 11 lbs., 3.6 oz. at 80 per cent fat, or 10 lbs., 6.7 oz at 85 5-7 per cent fat. The total number of tests, 74. S. HOXIE, Supt. Adanced Register, Friesian-Holstein Association.
Yorkville N. Y.

A Milkman's Opinion.

ED. HOARD'S DAIRYMAN:—Enclosed find $1.00 renewal subscription; I think it the best paying investment a milkman can make. Keep twenty-two cows; last year had twenty,

Rain or Shine,

The station agent is on duty. On his exact communication of train orders depends thousands of lives, and millions of dollars in property, each day. In his haste he runs out in the rain or the snow hatless and unprotected. Then comes the sequel—bronchitis, or some other disease of the respiratory organs. The most effective remedy for bronchial or pulmonary disease is Doctor Pierce's Golden Medical Discovery. Almost all remedies prescribed for such diseases contain opium or some narcotic which soothes by stupefaction. "Golden Medical Discovery" contains neither narcotics nor alcohol. It stops coughs by curing their cause. It heals weak lungs, builds up wasted tissues, and promotes the health of every organ of the body.

"I am a railroad agent," writes I. B. Staples, Esq., of Barclay, Osage County, Kans., "and four years ago my work keeping me in a warm room and stepping out frequently into the cold air gave me bronchitis, which became chronic and deep-seated. Doctors failed to reach my case and advised me to try a higher air, but, fortunately for me, a friend advised me to try Dr. Pierce's medicines. I commenced taking your 'Golden Medical Discovery,' and by the time I had taken the first bottle I was better, and after taking four bottles my cough was entirely gone. I have found no necessity for seeking another climate."

Dr. Pierce's Pleasant Pellets regulate the stomach, liver and bowels.

The Singer No. 15.

DOUBLE LOCK-STITCH.
OSCILLATING SHUTTLE.

A sewing-machine specially adapted for high-speed operation, producing greatest quantity of fine stitching, and requiring least effort by the operator. Has unusually large bobbin for lower thread and finest adjustment in all mechanical movements. Greatest range of work and lightest running lock-stitch sewing-machine in the world. Every genuine machine carries the trade-mark.

Sold on Instalments. You can try one Free. Old machines taken in exchange.

THE BOER WAR

is exciting acute interest in all parts of the world, but the subject of vital interest to agriculturists in all parts of the United States it

How to Make More Money on the Farm.

The surest way to do it is by following in the footsteps of those who are the most successful, and a path is blazed straight and clear through the columns of

THE PRACTICAL FARMER, of Philadelphia.

America's Leading Agricultural Weekly. $1.00 PER YEAR.

It is the only purely agricultural weekly published whose contents are directly applicable in an intensly practical manner to the every day work on the farm. Its editors comprise the leading agricultural writers of the country, and its **Unique Special Departments**—Experience Pool, Short Cuts, Mistakes, Failures and Successes, Farm Implement Annex and Postal Card Correspondence (all of which are supported by contributions from its readers, and for which contributions CASH PRIZES are paid every week), keep it in close personal touch with subscribers every week in the year.

The Practical Farmer's Library, issued quarterly, is one of the most valuable additions to agricultural literature ever published. You can learn full particulars of it in the columns of The Practical Farmer. **The Supply Department** of the Farmer Co., is prepared to quote you an inside price on anything you wish to buy, from a needle to an anchor.

No. 12 Farmers' Supply Catalogue contains 208 pages, illustrated and quoting wholesale prices on hundreds of articles of every day want. It also contains **a complete Calendar for 1900.** Send a postal card to The Farmer Co., 18th & Market Sts., Philadelphia, mentioning HOARD'S DAIRYMAN, and they will send you sample copies of The Practical Farmer, also a copy of No. 12 Supply Catalogue. **WRITE TO-DAY.**

SPECIAL OFFER.—By special arrangement with The Farmer Co., we are enabled to offer The Practical Farmer and HOARD'S DAIRYMAN both one year for **only $1.50.** Address all orders to **HOARD'S DAIRYMAN, Fort Atkinson, Wis.**

— BANKRUPT SALE OF —

A No. 1 DAIRY FARM

Said farm lies in the Mill Creek Valley, 7 miles from Richland Center, 1 mile from Boaz and a first-class cheese factory. It consists of 479¼ acres under fence and seeded down; over 200 acres under plow. Said farm must be sold to close out bankrupt stock. For further particulars address D. G. JAMES, Trustee, Richland Center, Wis.

The IMPROVED **VICTOR Incubator**

hatches all the fertile eggs; is simple, durable and easily operated; 168 page catalogue containing information and testimonials. **Sent free. GEO. ERTEL CO., QUINCY, ILL.**

part heifers, that made between $77 and $78 each. Holsteins and grades of same. No general-purpose cows, thank you. Have cows that averaged, last month, five to six gallons per day. Sell milk and cream at wholesale, on farm. Separate night's milk, sell the cream, and have skim milk to raise the heifer calves on. Think a heifer with second calf (3 years) worth $50. Have one now giving thirty-four to thirty-six pounds per day. Feed from 4 to 16 quarts bran, and 1 quart cotton seed meal, twice per day, corn fodder and corn on twice, and straw at night. Feed each cow according as she milks, and length of time from freshening. Think it pays to feed the heifers well.

Wishing you success in your work, I remain yours for the special-purpose cow.

Galesburg, Ill. L. F. HOZEN.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

PARTIAL PARALYSIS.

I have a four-year-old heifer, that acts very strange; when she is turned out of the stall one hind leg will drag, or not come along as it should, and crack up in the hip; it seems to be getting worse. Will this come right in time? W. W. S.

Hagersville.

ANSWER.

You seem to me to have a case of partial paralysis. This needs prompt attention, always; as soon as you can, get a practical professional man to see to your cow without delay. In the meantime give one, only, dram doses of nux vomica for two days, one each day; then one dose each alternate day for two, only, doses; then one dose each week for three to four weeks as may seem to be needed. Rub hard with sulphuric ether, 2 ozs ; oil of cedar, 4 ozs.; 4ffs. ammonia, 4 ozs.; fish oil, 25 ozs. Thoroughly shake before using. Always keep tightly corked and out of the sun.

TUBERCULOSIS.

I had a four-year-old heifer which I sold to a neighbor, who killed her for beef. When killed she seemed to be in prime condition, but when opened the fat around the heart and kidneys was of a very yellow color, and on the ribs, on both sides, several abscesses had formed about as large as a man's fist.

The butcher who killed her said that it was tuberculosis. Was this the case? Would this be hereditary, and what causes would bring on the disease?

Before we got this heifer, when it was a calf, and until it was a two-year-old, it did not receive proper care and nourishment. Would this cause the disease?

Columbus, Assa. SUBSCRIBER.

ANSWER.

The butcher was quite off in his opinion. I don't believe she had tuberculosis. All Jersey fat is yellow, all through. I can't account for the tumors, not abscesses unless they had formed pus Yes, tuberculosis is surely both contageous and infectious. I don't think lack of care likely to be the cause of the conditions you name.

SCOURS.—COLIC.—LOSS OF MILK.

1. I have an old mare about 20 years old, is good yet but she has the scours every winter, very bad. It does not make any difference what I feed her. I think her teeth are out of shape. She is all right in summer on grass.

2. I also have a span of geldings, about 11 years old, and they do not look just right. I am feeding good hay and corn and not doing very much with them. They have the colic very often and seem to be out of sort. One has a little sore on his shoulder since last spring, that does not heal up.

3. I have a fine heifer, came fresh last Agril, and gave a large mess of milk and about 2 months ago one quarter began to milk slow and slower until it is almost impossible to get any milk. The quarter never swelled or gave any bad milk and I have been very careful to get all the milk until now. She will be fresh in the fore part of March. G. F.

ANSWER.

1. You say about 20, this is 18 to 25 or more. Have her teeth rasped by a competent man.

2. Stop the corn and feed oats instead. Examine the teeth of both these also; 95 horses out of a hundred at the age you name, need the teeth rasped. Stop work for the healing of the sore and apply compound tincture of myrrh and aloes and calamine ointment.

3. Constricted channel of the teat as stated is made worse by hand milking. Read the advertisements in the DAIRYMAN and select the easiest milk tube.

BLEEDING FROM DEHORNING.

Will you kindly tell me what to do for a cow that was dehorned four weeks ago? One horn took to bleeding while I was away and had hard work to stop bleeding. She is weak from bleeding and staggers when she walks. They shrank in milk from ten quarts per day to one quart in two days' time. What shall I do to restore blood and would it be best to dry her off? W. H. G.

Warrens, Wis.

ANSWER.

No doubt the poor cow shrank her milk from the dehorning; what else could you expect? Your action was cruel and very indiscreet to do this so close to calving. I would not recommend a styptic, but compound tincture of myrrh and aloes, liberally. This will heal and so stop the bleeding gradually. No, don't dry her off.

ROPY MILK.

I have a very fine Jersey cow, which will be fresh between the 15th and 25th of the month. The left hind quarter of udder is swollen, but milks easy. The milk being lumpy; and when come from teat will unroll like tough leather. I had a surgeon examine udder and he said it did not need a milk tube, but he thought she would lose that quarter. I gave her condition powders in a little bran to loosen bowels, and bathed udder with hot dish water and rubbed udder with salve made with old bacon grease and bitter sweet; her udder gets worse, as the time draws nearer to calving. H. ROUSE.

Crittenden, Ky.

ANSWER.

The physic was all paramount, and would have saved the quarter no doubt, if it had been judiciously followed up. Condition powders, so called, are a disgrace to an intelligent cow keeper or horse keeper. They have caused the death of hundreds of horses and cattle. Dish water and old bacon grease belong rightly to the condition powders, etc. Physic is all I can give you to be immediately efficacious. Rub the udder hard with camphorated spirits, six parts, and common turpentine, two parts only, twice the first day, then once a day for two or three days, as may seem to be needed.

HABIT.

Can you tell me what makes some of my cows press their noses against the manger and make a loud noise breathing; they are in good fix and look and eat well. They did some last winter. E. W. K.

Lincoln Co., Wis.

ANSWER.

The loud noise no doubt comes from the obstruction to natural breathing by the pressure against the manger. To me, you have a lot of cows which have singularly acquired this habit. If only one cow, I should say the cause was a carious tooth, or teeth, but as you say, it can't be that; must be a bad habit only.

THROAT TROUBLE.

I have a fine young cow, grade Jersey, which has some affection of the throat, causing a labored breathing, and upon slight exertion, a wheezing sound is issued. She is gradually wasting away, and will probably soon die, unless some heroic remedy is adopted. B. F. R.

Ellensburg, Wash.

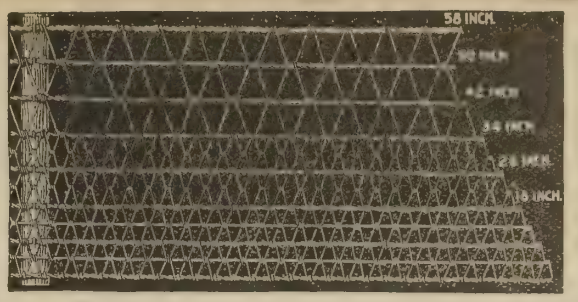
ANSWER.

Your case needs a professional examination to be able to get to a correct diagnosis. She may have some form of tumor in the trachea, might also be in the esophagus, and thus press upon the walls of the windpipe Worse than all, she may be in the developed form of tuberculosis. I fear the milk is unfit for use. Suspicion, in my mind, is strong as to the latter disease. If you have a state veterinarian, let him examine the cow.

1. A friend of mine has a cow which got one of her teats injured. He used a silver milking tube for 2 weeks. When he resumed milking by hand, he found the teat gave less milk than any of the others. How do you account for this? Is the cow permanently injured in that teat?

2. When a cow is drying up naturally, or you wish to dry her up six weeks or so before calving, is it advisable to milk her only once a day, when she gives a gallon of milk daily?

3. A cow has a small hole in one of her teats close to udder. Can this hole be closed when she is dry, and how? It leaks a little sometimes when milking. J. D. REID.



Metchosin.

ANSWER.

1. I account for the loss of the milk from the accident as a matter of course.

2. All depends upon the conditions as to milk secretion, etc. Usually such a course is all right.

3. To be operated on by an expert V. S. The hole to be made sore inside and then sewed up.

ILLUSTRATION.

Cost $4000; You Get It For 15 Cents.

The Money-Makers in the poultry business, whether owning a dozen hens or a thousand, are the people who watch what other successful poultry-keepers are doing and how they do it. It is to disseminate just such knowledge as this that "*How to Make Money with Poultry and Incubators*" was published. It is admittedly the handsomest book ever printed treating of the poultry question. It contains nearly 200 illustrations and numerous other features which brought its cost up to more than $4,000 While it gives complete information regarding the *Cyphers Incubator* it is primarily a guide and manual for the person who is considering poultry from a purely business and money-making stand point. Its 192 pages (9x11 inches) are filled with practical articles, written expressly for this book by leading poultry experts. For example, Geo. H. Pollard, the well-known practical poultryman, contributes three chapters on "Profitable Broiler Raising," "Winter Chickens or Roasters," and "Best Breeds for the Market." Michael K. Boyer of national reputation, has an article on "Poultry for Profit on One Acre;" Myra V. Norys tells what energetic women have done in "Women's Work with Poultry;" A. F. Hunter, the well-known editor, discusses the "Demand for Fresh Eggs and How to Meet It;" Jas. Dryden, of the Utah Experiment station, writes of "Pullets vs. Hens as Profitable Layers." These are only a few of the many special articles. In addition there are many photographic illustrations and descriptions of the largest and most successful poultry farms in the world; also numerous copyrighted plans and specifications for laying and brooding houses, together with letters from over 250 successful poultry keepers reporting their experience with the Cyphers Incubators. Sent to any address for 15c. postage. Ask for Book No. 123 Address nearest office, The Cyphers Incubator Co., Chicago, Ill., Wayland, N. Y., Boston, Mass

An Illinois Dairy.

$70.00 Per Cow.

ED. HOARD'S DAIRYMAN:—You will find inclosed a draft for one dollar for the renewal of my subscription for your paper. At this writing, the year is so near gone that I can sum up very nearly what has been the outcome of our dairy for the year. My cows have done fairly well; from butter alone I have realized $70.00 apiece on an average for the year just now closing, not taking into consideration calves, skim milk, and what butter and cream was used in family. We run our separator and churn with gasoline engine which gives entire satisfaction. It costs me about 25 cts. a week to run it to do all of my separating and churning. We get from 22½ to 25 cts. a pound for all the butter we can make. I have one heifer that dropped her calf last May, one year ago, at twenty months old, and within one year made 445 lbs. of butter which I think is very good for one of her age. I find that it pays to breed along the dairy line and to take care of them when you get them. I think my herd will do better next year than this, as they will be more mature; a good many are young, first and second calves. I am satisfied there is no industry that can be carried on the farm that will pay as well as dairying if a man has the right kind of cows, and attends to them as they ought to be taken care of; and, on the other hand, they will run their owner in debt every day that he keeps them, so you see I think it is all in the cow and the way she is taken care of.

Loami, Ill. DANIEL STALEY.

Kafir Corn.

ED. HOARD'S DAIRYMAN:—I see by the New York *Tribune*, that the kafir corn in the western states is becoming very popular. The reports in Kansas, show an acreage of 582,895 last year, in that state alone. Wish you would give in your paper, some facts in regard to the corn, and mode of cultivation, the amount of seed per acre, and how crop is handled, whether it would be a success in Ohio, etc. C. N. G.

Munroe Falls, Ohio.

From a recent bulletin of the Kansas Experiment Station, we copy the following:

Kafir corn is grown in every county in Kansas, Secretary Coburn reporting 582,895 acres in 1899 for the state, yet we are in constant receipt of letters asking how to raise and how to feed it.

It has been raised on the Kansas Agricultural College farm for the past eleven years. We recommend two varieties—the Red and the Black-hulled White. For the first seven years, we raised the Red. The Black-hulled White was then introduced, and from 1896 to 1898 we grew these two varieties side by side, the Red giving an average yield of 37 bushels per acre, and the Black-hulled White 43 bushels per acre. We now raise the Black-hulled White only. In western Kansas many farmers think the Red a little hardier in drouth.

Kafir corn makes a slow early growth, and should not be planted until the ground becomes warm. On cold soils, surface planting is best; on warm soils listing does well. Plant in rows 3 to 3½ feet apart, dropping single seeds an inch apart in the row. Cultivate the same as you would for a good crop of corn. Many farmers sow kafir corn broadcast, cut with a mower, handle and feed as hay.

When grown for grain, the heads may be cut off and gathered, if the fodder is not wanted. When the fodder is to be used, the cheapest method of harvesting kafir corn is to cut, and put up in large shocks.

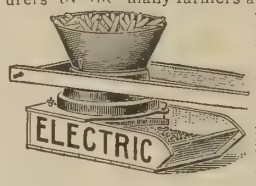
The College farm is upland. In the eleven years that we have grown kafir corn, there has been but one failure to produce grain. In 1894, kafir corn yielded no grain, but gave two tons of fodder per acre. Corn, the same year, yielded us no grain, and one ton of fodder per acre. The average yield of grain per acre on the College farm for the past eleven years has been, per year: Kafir corn, 46 bushels; corn, 34½ bushels. Our highest yield per acre in one year has been: Kafir corn, 98 bushels; corn, 74 bushels. In the western half of the state, the difference in favor of kafir corn is greater, as there, in dry years when corn yields one to five bushels per acre, the yield of kafir corn is 25 bushels or more.

A bushel of corn is worth more for feed, than a bushel of kafir corn, but on the College farm, an acre of kafir corn is worth more than an acre of corn. The average of the results, where we have fed corn against kafir corn in fattening hogs, shows 12 pounds of pork from a bushel of corn, and 10 pounds of pork from a bushel of kafir corn. This shows for the College farm (upland) an average yield of grain per year, per acre, to produce 460 pounds of pork from kafir corn, and 404 pounds of pork from corn.

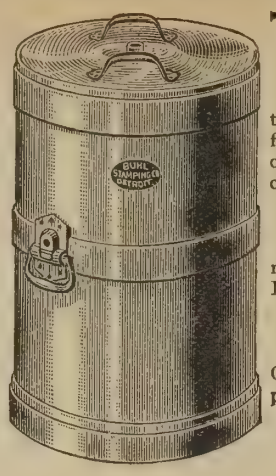
The relative values of corn and kafir corn are, practically, the same for beef production as for pork.

Kafir corn grain and alfalfa hay make the cheapest combination of feeds in Kansas for milk production.

Kafir corn meal is especially valuable to feed calves raised on skim milk. Its constipating effect offsets the loosening tendency of the milk.



Animals tire of kafir corn alone, more quickly than they do of corn alone, but combined with other feeds, they relish it for any length of feeding.



In three experiments in fattening hogs, a mixture of kafir corn, four-fifths, and soy beans, one-fifth, gave a gain, per bushel of feed, of over 36% more than kafir corn alone. Hogs fed kafir corn and alfalfa hay gained 91 pounds each, while hogs fed kafir corn alone, gained 52 pounds each. Hogs fed kafir corn and five pounds of skim milk, each, per day, gained 66 pounds per hog, while those fed kafir corn alone gained 42 pounds each.

Kafir corn is our best drought resisting, grain feeding crop, and our heaviest yielder on poor soils. We recommend it in place of corn for the uplands of eastern Kansas, and for all soils in western Kansas. When this recommendation is followed, and the kafir corn is fed with the drought resisting feeds rich in protein, the beef, pork and milk production of Kansas in dry years will be equal to that of our best years now, without more acres being planted.

ILLUSTRATION.

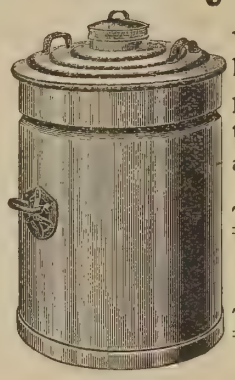
We present herewith a cut of the Electric Sweep Feed Mill which is manufactured by the Electric Wheel Company, of Quincy, Ill. This mill introduced this season for the first time is the direct result of repeated demands made upon the manufacturers by the many farmers all over the country who are using other Electric goods, and who, finding those so entirely satisfactory, urged the manufacture of a mill also. The "Electric" embodies in its plan and construction all the latest principles, modern, economical grinding of feed for stock. It is without gears of any kind and does not absorb or waste any power by that method. It is equipped with a double set of brakes, which effectually break up and reduce the ear corn before passing it on to the burrs. The burrs are made of specially hardened white metal, smooth and sharp, and capable of long continued service. Mill is easily adjusted to grind coarse or fine, and in addition to grinding ear corn will also grind all small grains singly or mixed. For very fine work an extra set of burrs are provided. Write the Electric Wheel Company for booklet on feed grinders.

The Best Factory Cans.

The strong points of the Buhl Milk Cans are their great strength, heavy coating of pure tin, and fine finish. They do not rust like common cans, have no crevices inside, will not leak, and need no repairs. No other cans have the Genuine Heisey Side Handles.

Look for the Milk Can Trademark.

This can has 3 welded, tinned, wrought-iron hoops, tinned malleable side handles, and heavy XXXX genuine Cookley K cylinders. Capacity, 15, 20, 30, 40, and 50 gallons.

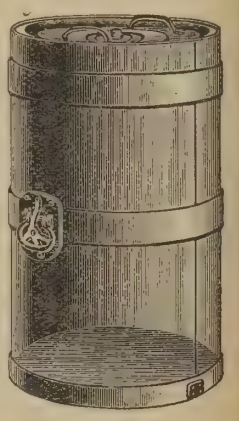


Refuse Imitations.

We make all patterns and sizes of Factory and R. R. Milk Cans, and will gladly mail you our hand-book free. **We make prompt shipment.**

The Buhl Stamping Co.,
DETROIT, MICH.

Factorymen



who guarantee their cheese and butter, should see to it that their patrons are supplied with cans that can be kept absolutely clean and easily inspected.

EMPIRE STATE.

The EMPIRE STATE CAN is the best because it is ventilated, and the milk cannot slop out.

The UNION CAN is the best old style Factory Can. Send for special circular and price list.

UNION.

Mentron this paper.

The "Ship of the Desert"—"Planet Jr." Rudder.

We have not read anywhere that the "Ship of the Desert" required a rudder, but certainly we could suggest no more profitable or appropriate one than appears in this cut. This "PLANET JR." Horse Hoe is extensively used in Egypt for the cultivation of cotton. In this country it is the standard machine for cultivating that crop and also corn, potatoes, tomatoes, cabbage and all other crops which are cultivated with one horse. We were the original inventors of Horse Hoes nearly thirty years ago, and have steadily maintained our position as leaders among the makers of this class of goods.

We make also a complete line of Horse-hoes, Wheel-hoes, Pivot Wheel Cultivators, Spring Tooth Orchard Cultivators, Four-row Sugar Beet Cultivators, Sugar Beet Seeders, &c., each equipped with a variety of attachments for many purposes.

Our new 1900 catalogue—of which we issue 350,000, is the handsomest, best and most instructive book ever issued on a similar subject. Gives an extended treatise on agriculture at home and in foreign lands. Full of little points that bring profit. Full of true and handsome illustrations. We mail it free to any address on application.

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

HOARD'S DAIRYMAN.

HOUSE FOR CLEAN CLEANING
SAVOGRAN INDIA ALKALI WORKS,-BOSTON.
Medals—Bronze 1878, Silver, 1887, World's Fair, 1893.

WON'T WASH CLOTHES.

If you want a machine for the clothes laundry don't buy a churn; and if you want a butter churn for the dairy, don't get a combined washer and wringer. At any rate, before buying a washer and wringer in the shape of a combined churn first experiment with your wife's wash tub and clothes wringer and see how your butter likes it.

You should SQUEEZE and PRESS the butter when working it and not grind, rub wring or smear it, or else you will loose the grain and with it the good price you should receive for the butter.

The Squeezer Combined Churn

Handles the butter just right. It gently but persistently "squeezes" the buttermilk out, thus preserving the grain, and this no other combined churn does. In a nut shell,

Its made RIGHT.
Like all Sharples goods.

Do you know of any other vat made that is equal to the Sharples Co. Vat? If you do, come and tell us about it for we have money to give to the man who can show us an improvement on a Sharples Co. Vat. We are hunting such men.

Do you know of any other Butter Printer as good as the **"All Over" Butter Printer?** It is simple, very simple (that is another feature of **Sharples** goods) and it prints the butter on four sides and the top. It's cheap, it's durable, and it's handy.

Certain it is that you don't know of any Cream Separators equal to the SHARPLES CREAM SEPARATORS, for there are none.

The Sharples Tubular Separator stands supreme among those creamerymen who are familiar with it, and they are the ones who are in position to judge as to its merits. If you want a creamery outfit complete we want to furnish it to you, and will make you figures and render you service that will please you. If you want any part of a creamery outfit we want to furnish it and will be glad to hear from you. Write for prices.

FACTORIES { West Chester, Pa., And Dubuque, Iowa.

A CLEAN SKIMMER

At All Seasons Of The Year.

It means something to have a cream separator that you can depend upon as being absolutely reliable in all kinds of weather and under constantly varying conditions. Such a separator is the world renowned

Sharples Tubular Separator.

The following letter from a well-known Wisconsin creameryman is only additional evidence as to the merits of the TUBULAR.

WALTER J. DAVIS,
PROPRIETOR OF
Brookside Creamery.

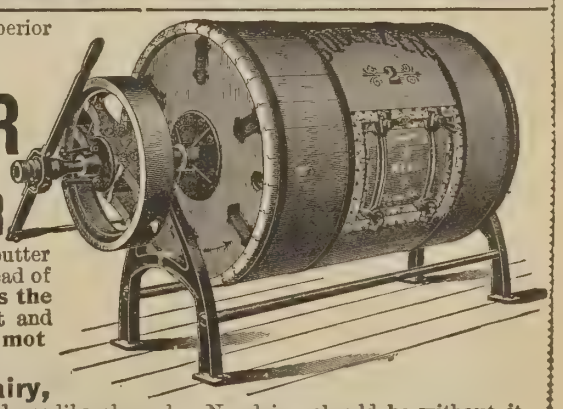
BROOKSIDE, WIS., Dec. 16, 1899.

The Sharples Co., Chicago, Ill.

Gentlemen:—Your letter of inquiry as to how I am pleased with the Tubular;—after running it through the spring, summer and fall, and up to this time in winter, will say it has given entire satisfaction. It is easy to operate; my fuel and oil bills have been very much reduced, as well as annoyance of belts breaking, always when you are in a hurry. I find it a close skimmer, never above 5-100 of one per cent, and as a rule a mere trace. I have used different makes of separators and like the TUBULAR best. If I need another machine can assure you I shall buy no other make. Yours truly,

WALTER J. DAVIS.

Do not buy a separator until you have given the Tubular a trial. Do not sign a contract for any separator unless that contract gives you the privilege of trying the Tubular at the same time and of buying the separator which suits you the best. Do not be fooled by the fellow who is talking so much about his complicated separator "standing in a class of its own." Possibly he is right,—like the dull boy who stood first in his class because his school mates had all gone ahead and he was the only one left in his class. You do not want a back number; you want the best, the separator which has outclassed all others—the Tubular, A CLOSE SKIMMER OF LARGE CAPACITY, SIMPLE, DURABLE AND EFFICIENT. TRY IT.



Send for Catalogue No. 46.

The Sharples Co., Canal & Washington Sts., CHICAGO, ILL.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

It is always in order to take a whack at oleomargarine, the greatest food fraud of the nineteenth century. The business of legitimate dairying, a business which lies at the very foundation of a permanent agricultural prosperity for this country, is imperiled by this fraud to a greater extent than the dairymen of the country themselves realize. They should rise as one man and demand of the government such legislation as will absolutely prevent this fraud being sold under the name of butter.

The kidney fat of a fat steer, such fat as it is claimed is used for the production of better grades of oleomargarine, will weigh about 40 lbs. Assuming that the average cow will produce 160 lbs. of butter in a year, it will take four steers to offset one cow as a butter producer. Enough oleomargarine was made last year to offset the product of over 400,000 cows, so if this choice fat was used alone in its production, 1,600,000 steers were drawn upon, but there was not any such number of steers killed, and so it proves that oleo is not made of that sort of fat.—*Racine Journal* (Wis.)

DRY MATTER AND DIGESTIBLE NUTRIENTS.

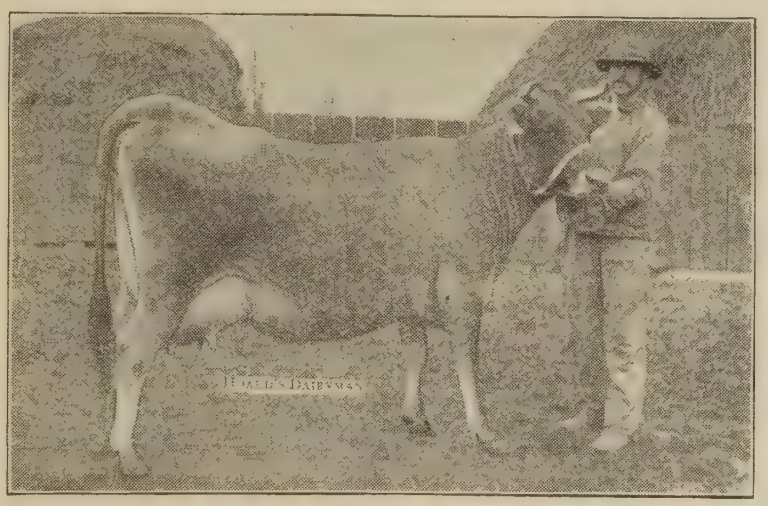
It happens now and then that we receive an inquiry from readers saying that they do not see how, for example, 12 lbs. of clover hay can contain 10.16 lbs. dry matter, .82 lbs. digestible protein, 4.31 lbs. digestible carbohydrates and 0.20 lbs. ether extract, saying that according to these figures we get more pounds out of the hay than we started with. Not so; if they would read a little more carefully, and especially if they would consult the glossary which is printed at the head of that department, they would understand that the digestible nutrients were simply a part of the dry matter, and that the balance of the dry matter passes off undigested.

THE BULL AND HIS TREATMENT.

To every dairy farmer this is a subject of deep interest. The bull always presents a problem more or less difficult to solve. Some men seem to "catch on" and solve it readily and easily; others stumble along, and results show no improvement in their herds after years of experience. Some men are keen, close judges of a bull, others are not; some men know how to handle a bull so as to insure safety, health, vigor and unabated breeding power; others make a failure of all these things. It is impossible to make the foolish wise, or the weak strong, but it is the duty of the DAIRYMAN to select and present continually the best thought on all dairy subjects, it can find.

The United States Department of Agriculture has issued a Bulletin, No. 55, on the "Dairy Herd", in which we find the above subject treated excellently well, and from which we make the following extracts:

* * * *



The bull is always the main dependence for raising the average quality of the herd, and should be chosen with this object in view. This is especially true if the cows are grades, and "grading up" is in progress.

The grade dam may be selected and largely relied upon to give size, form, constitution and capacity of production to her heifer calf; the inbred power, its dairy quality to increase the richness of milk, is derived from the pure-bred sire. One cow may prove a poor dam, or fail to breed, and still give a profit in milk. But if the bull fails or proves a poor sire, the entire increase of the year may be lost.

In getting a bull get the best; at least of breed. In all breeds (as among men) some bulls will be found of naturally bad-temper, but it is believed that the great majority of bulls of all dairy breeds can be safely kept until too old for service, and handled without serious trouble, if only properly reared and judiciously managed.

In rearing a bull accustom it to being handled from calfhood, but without fondling or encouraging frolic. Give it kind, quiet, firm and unvarying treatment, and keep it always under subjection, that it may never know its strength and power.

Insert the nose ring before it is a year old; keep this renewed so as to be always strong, and always lead and handle the animal with *a staff* in the hands of a discreet and trusty man. The bull should never run loose in a yard or pasture, but should be provided with abundant and regular exercise, always under restraint and full control. The "walk around" arrangement, like sweep horse power, affords a fair degree of voluntary exercise but it is hardly sufficient. The best plan seems to be to provide a suitable tread power with a governor attached; place the bull in this daily and let him walk a fixed time or distance. The main object should be regular and sufficient exercise for the bull.

IDA OF GLENDALE, A. J. C. C. 104083.

Property of F. H. SCRIBNER, Rosendale, Wis.

approach that standard as nearly as possible. Make a study of the animal's pedigree and the dairy history of his ancestors, and especially of the females among his nearest kin. *A common error among dairymen is to use immature bulls*, and to dispose of good ones before their merit as sires has been fairly proven.

Bull calves are cheap and young bulls are considered much easier to handle. But it is good advice to the buyer to purchase a bull of some age, whose progeny prove his value as a breeder, rather than a calf of exceptional pedigree; and to the owner having proved excellence to keep him and use him for years, or as long as he proves himself potent and pre-potent.

* * * *

The chief objection made to bulls of some age is that they are likely to be vicious and dangerous. Everyone recognizes the difference in temperament between the fleshy, beefy bull and the one of pronounced dairy character; but experience and observation have taught that the bulls of marked dairy type are much alike in disposition, regardless Incidentally, he may be made to run a fodder cutter or a cream separator, and perform valuable service.

As age and strength increase, let the staff be supplemented by a strap, chain or rope attached to a second ring. To this may well be added some hitching or leading chain with a strong strap around horns or neck. Let there be always a double hitching device, so that the bull may never by accident find himself loose when he should be tied.

If restiveness and temper are shown, add to the exercise in duration or quantity without violence; a bull physically tired may be depended upon to be quiet and easily managed.

It is much better to keep the bull as much as possible in the presence or in full sight of the herd than be stabled by himself in a lonely place. Let him be in the same room with the cows during the stabling and at milking times the rest of the year."

Cow Pea Hay.

ED. HOARD'S DAIRYMAN:—Ricardo Jimenez, San Jose de Costa Rica, writes: I intend to follow the instructions given by you in HOARD'S DAIRYMAN about cow pea hay. But to avoid blunders and relying on the well known benevolence of scientific men, let me put you these questions:

1. How long do you allow the peas to wilt in the sun?

2. Is there anything particular to be done for getting the process of wilting entirely accomplished?

3. Which is the average highness of the cocks?

4. How can I know that it is necessary to open the cocks?

The time allowed for the wilting of the peas depends on the season and on the weather. In the warm, clear weather of August and September, we allow them to wilt from 12 to 48 hours. Great care must be exercised in this particular and the peas must be watched very closely and as soon as they give any indications of becoming at all brittle, they must be put in cocks at once, as the leaves will otherwise be broken off and lost, and as they are richest in protein, this would be very unfortunate. In bad weather it is sometimes necessary to cock them up when they have had but slight opportunity to wilt. It is somewhat difficult to preserve them this way and they require to stand longer in the cock. A hay tedder run over the field once or twice, throwing the vines up to the sun would aid considerably in helping the wilting process to go on rapidly and uniformly. This machine costs little more than the ordinary hay rake and is almost indispensable on any farm where hay making is practiced, and is especially valuable where either peas or clovers are to be made into hay.

The average height of the cocks is from 6 to 8 feet. A very good method of handling the peas is this: Run the tedder over them, let them wilt as much as possible so they will not be brittle, rake with an ordinary hay rake into large windrows and allow them to stand there and wilt for a day or so, then run the hay rake down the windrows, bunching the peas into large heaps. The cocks may now be made midway between two of the large bunches made with the rake. This will give a good average sized cock. In some localities where an abundance of sedge grass or other coarse by-products are available, it is an advantage, especially in bad weather, to make a foundation for the cock of this trash. Then put on a layer of peas and then another of sedge grass, and so on until the cock is completed Put a good cap of the rough trash on to shed the water. Sedge grass is especially valuable for this purpose, as it sheds water with remarkable success. I would not resort to this method of curing except in bad weather, as it involves considerable labor, and is therefore more expensive, but there are times when it is the only means to the desired end.

You will know when it is necessary to open the cocks by examining them from time to time. When you find them very moist on the inside, there is danger, of course, of mold, and sometimes when they heat very much, of fire-fang. By opening down midway two or three times in the morning, the sun evaporates this moisture and aids materially in curing the hay.

ANDREW M. SOULE.

Tennessee Experiment Station.

What a Dairyman Thinks.

ED. HOARD'S DAIRYMAN:—I think it just to speak up and say what we think when we see an honest endeavor in any line.

Most people will speak when there is any fault finding to do, then keep quiet when they are satisfied.

I think the DAIRYMAN is the most practical and goes down the deepest in hard study of any paper I ever saw.

The formulas for feeding can hardly be estimated in dollars for the farmers. The only fault lies with themselves—they don't read enough. JOSHUA MINTHORN,

Iosco Co., Mich.

Coming Events.

Cheese and Butter Association of Western Ontario, Jan. 16, 17, 18, 1900, at Stratford.
Pennsylvania State Board of Agriculture, Harrisburg, Jan. 24-25, 1900.
Tennessee Dairymen's Association, Sweetwater, Jan. 25, 1900.
Eastern Cheese and Butter Association of Ontario, Ingersoll, Jan. 31-Feb. 1, 1900.
Wisconsin Cheese Makers' Association, Madison, Wisconsin, February 7-8-9, 1900.
Ohio Dairymen's Association, Columbus, Feb. 13 14, 1900.
Wisconsin Dairymen's Association, Watertown, Feb. 13-16, 1900, Geo. W. Burchard, Sec., Fort Atkinson.
Prince Edward Island. Marshfield.
Michigan Dairymen's Association. Detroit.
Creamery Buttermaker's Association, Lincoln, Neb., Feb. 19-23, 1900.

THE program for the 28th annual meeting of the Wisconsin Dairymen's Convention, at Watertown, Feb. 13th to 16th, received too late for publication this week. Copies may be had by addressing the Secretary, G. W. Burchard, Fort Atkinson, Wis.

THOSE Herd Premiums offered by the Wisconsin Dairymen's Association should bring out a good competition. How much butter or cheese did your herd make last year? The Association offers $150 in premiums for the best herd. Write to the Secretary for full particulars.

WHAT IT COSTS.

"What will I get?" is asked a thousand times by dairymen where they once ask, "what does it cost?"

And curiously enough too, the price they are to get is nearly always beyond their control while the cost end of the string is always in their own hands. To reduce the cost of producing milk is always a most profitable study.

Commissioner Norton, of Iowa, in his annual report shows clearly that the cost of making butter in a creamery is largely governed by the amount of milk the creamery receives each day.

So it is with the cost of producing that milk on the farm. The cost of the butter per cow is conditional upon the amount she will produce in a year. Do the farmers think of this who prefer to keep poor general-purpose, —we might say no-purpose—cows rather than make a sensible effort to breed a class of cows that will add greatly to their yearly product. It is not all of farming to simply work hard.

A GOOD PHRASE.

The Knoxville *Tribune* talks to the farmers of Tennessee in a very plain and sensible manner about the necessity of their doing something in the way of dairy farming at once. The writer, who is evidently a good reasoner on this question, speaks about the necessity of each farmer having sound ideas on dairy management. These ideas, he calls "mental furnishing." It is a good phrase to use, and applies to the case of every man who keeps cows whether he lives in Tennessee or not.

What a host of men there are in the business whose minds are badly "furnished." And what is a curious fact, is that they are perfectly contented to live so. An Irish friend of ours was once describing his mental condition to us about as follows: "Indade, there was for years when, begorra, I did but little good thinking on the dairy business. Troth, I belave my cows had it on their minds more than I did. It is mighty bad for a cow,sor, when she has to make the milk and do all the thinking besides. I'm helping them a little now. Kape up your firing at us."

Packing Small Quantities of Ice.

ED. HOARD'S DAIRYMAN:—In one of the December numbers of the DAIRYMAN, some one inquires about how to keep ice on a small scale. As I have kept ice for my own use with perfect success, in an ice house 12 feet square, I will tell how I did it, for what it is worth.

I built a stone foundation, 1 foot thick and about 8 inches above the ground—covered the top of this with a thick layer of soft mortar—then bedded 4 pieces of 10 inch wide plank, in the mortar, to be used as sills and a foundation on which to build the superstructure. Then I used 2×10 plank for studding, boarding them up tightly on both inside and outside and packed the spaces between the studding full of dry sawdust and covered the top with a water tight roof.

No floor is needed except the ground. Cover this with 18 inches of sawdust before beginning to pack ice—the ice being very heavy will greatly compress the sawdust. Have your ice cut in cakes of even size and pack them together as tightly as possible, standing the cakes on edge. If when the first layer is in, there are any uneven places on the top of it, hew them off with an adze or ax.

If there is snow on the ground spread a layer of it two or three inches thick on top of the first layer of ice, it will greatly assist in making the next layer "stand up" and moreover will almost completely retard the circulation of air between the ice cakes, also cowd snow, if you have it, into all the spaces around the outside of the ice next to the wall. Add in the same manner as many successive layers as you desire and then cover the top of the ice with a foot or fifteen inches of dry sawdust and the ice will keep until ice comes again.

Ice can be readily kept in almost any building by standing the cakes a foot from the wall and then pounding the space between the ice and the wall, full of dry sawdust.

There must be no floor in the ice house except it be flat upon the ground as all circulation of air must be stopped or the ice will surely melt.

Where one expects to pack ice year after year it pays to build an ice house and the object of building one with a foundation and plank bedded in mortar as is mine, is to prevent rats from getting into the sawdust between the studding If they once get in there they will cause great hollow places in your sawdust wall with resulting loss of ice.

There was still ice in my ice house January 1st, 1900. B. A. C.
Toledo, Ohio.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

	DIGESTIBLE NUTRIENTS		
Dry matter.	*Protein.*	*Carbohydrates.*	*Ether extract*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FOR AN ILLINOIS STATE INSTITUTION.

Please formulate a ration from the following feeds, for Holstein cows, (I want to use all the corn and cob meal that I can): Clover hay, sheaf oats, corn and cob meal, bran and oil meal. C. H. H.
Jacksonville, Ill.

If these cows are fresh in milk, or nearly so, and are adequate representatives of their breed, we do not think the following allowance will be any too much:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover	8.47	.68	3.58	.17
10 lbs. sheaf oats	7.15	.40	3.60	.17
6 lbs. corn and cob meal	8.34	.38	3.78	.21
3 lbs. bran	2.64	.38	1.16	.09
2 lbs. oil meal	1.82	.59	.65	.14
Totals	25.42	2.43	12.77	.78

FOR A PENNSYLVANIA MILKMAN.

I have corn fodder, oat hay, and corn and cob meal; must buy bran at $19; linseed meal, $26; cotton seed meal $26; I am, therefore, anxious to use as much as possible of the feeds I have on the place. R. C.
Norristown, Pa.

R. C's. cows weigh about 1,000 lbs. each. If they have not been too long in milk we think it would pay him to feed, on an average, about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn fodder	7.10	.37	4.04	.12
10 lbs. oat hay	9.11	.43	4.64	.15
6 lbs. corn and cob meal	5.34	.38	3.78	.21
2 lbs. cotton seed meal	1.83	.74	.34	.17
2 lbs. oil meal	1.81	.59	.65	.14
Totals	25.19	2.51	13.45	.79

PARTITION IN ROUND SILO.

What is the objection, if there is any, to putting a partition in a round silo? Would not it be better than building two small ones? R. L. H.
Berk Co, Mass.

If the silo is already built, it is better to put a partition in than to tear down and build two new smaller silos, but where the silo is to be built, two small silos are better.

If a partition is put in, care must be taken to fill up the sharp angles that are formed; otherwise the silage is liable to spoil.

SILO IN BARN BAY.

Would there be any objection to placing silo in barn bay where dimensions (on account of barn frame) would have to be 10 feet by 18 feet and 25 feet high? J. W.
Elizabeth, N. J.

The above are not perhaps the most economical dimensions for a silo, there being a large proportion of wall to the silage enclosed, but there is no reason why it should not be successful if care is taken in packing the silage well along the walls, when filling.

CAUSES OF ABORTION.

An Ohio subscriber asks what is the cause of this disease, and how to treat it. The answer is that many causes produce this trouble, and that treatment which might be satisfactory under one set of circumstances would be wholly useless under some other set of circumstances. So far as the advertised remedies in the DAIRYMAN are concerned, we have to say that we have received personal letters from our readers who have tried them, some reporting that they worked like a charm in preventing abortions in their herds, and others reporting that they cannot see that they derived any benefit from their use. This is much the case with all kinds of medicines for all kinds of diseases, whether for man or for animals, and proves that causes of various diseases are so hidden that doctors themselves are at loss what to do. We are all too ready to jump at conclusions. If we try a certain medicine once and it seems to produce the desired effect we conclude that it must be an infallible remedy in all cases. On the other hand, if we try a prescribed remedy for a certain disease, and it fails to cure, we just as readily conclude that it is worthless; and so it goes with all things, different men holding different opinions upon the same subjects.

Among what may be termed domestic remedies for this disease we incline to favor liberal doses of asafœtida. This may be given in tablespoonful doses every day, or even double this amount, if the danger seems to be imminent. As a rule, an approaching abortion indicates itself some two or three days in advance, and there is plenty of testimony to the effect that the remedy above mentioned wards off the difficulty. We are also inclined to place a good deal of confidence in the carbolic acid treatment, details of which are given in another column of this issue.

OATS OR BRAN IN WYOMING.

H. R. Heath, Big Horn, Wyoming, thinks he is in the greatest natural dairy country in the United States, and certainly he sets forth a great many advantages for his section of the country. They have the pioneer creamery plant of the state, doing fairly well, making a fine grade of butter. The farmers there are passing through the same experience that farmers everywhere meet, when they take up dairying in connection with general farming. The money received from cows seems almost like money found.

Alfalfa hay is worth only $3.00 per ton; oats, $16 per ton; wheat the same, and bran, $12. There is no corn in that country, and to ship it in adds so much to its cost, that it becomes prohibitory.

The bran is somewhat cheaper than the oats, but we incline to the opinion that when the quality of the resulting butter product is taken into consideration, in connection with some other advantages produced by oats, we should feed pretty largely of oats as a supplement to the alfalfa hay. Alfalfa has a tendency to produce a soft butter; bran has a somewhat similar tendency, whereas oats tend to produce a firmer butter. The amount to be fed will, of course, vary with varying circum-

stances, but as a rule we should feed from 6 to 8 lbs. of oats (or bran) to each cow daily. To the largest producer, even this amount may be considerably increased, and conversely to the small producer, it should be materially decreased.

FOR GEORGIA JERSEYS.

T. C. C. Jr., Carterville, Ga., has a herd of Jersey cows, makes butter and sells it at 24 cents per pound. He has cow pea vine silage, and shredded corn stalks for roughage, and wants to know what is the best combination of grain to go with them to make a balanced ration. Wheat bran is worth $17 per ton, corn, 40 cents per bushel; and the latter he can grind on the premises, making corn and cob meal. Nothing is said by this inquirer about cotton seed meal, but we would not hesitate to advise its use in moderate amounts, whether in the south where it is produced, or elsewhere. We are of the opinion that these cows might be fed daily on an average, about 40 lbs. of cow pea vine silage, 10 lbs. of stover, 4 lbs. of bran, 4 lbs. of corn and cob meal, and 2 lbs. of cotton seed meal. This would bring the digestible protein up to 2.27 which is not far from the accepted standards.

AN IOWA RATION.

Please formulate a ration for fresh milk cows from corn fodder, timothy hay and oat straw; corn at 25 cents per bushel; oats, 20 cents; bran, $10 per ton and oil meal, $25 per ton.

I have been a subscriber to your valuable paper for two years, but have never seen a ration formula to suit me. A SUBSCRIBER.

Dows, Ia.

It is quite probable that a formula devised especially for our friend, may fail to suit him; in fact, it fails to suit us, but the best that we can do under the circumstances, is to say, first of all, sell the oats and buy bran. Oats at best are not worth to exceed 10% more than bran. When the exchange is made, adopt something substantially as follows for a formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
8 lbs. timothy hay	6.94	.22	3.48	.11
10 lbs. stover	5.95	.17	3.24	.07
5 lbs. straw	4.54	.06	1.93	.04
6 lbs bran				
4 lbs corn and cob meal	5.29	.75	2.32	.18
2 lbs. oil meal	3.56	.26	2.52	.14
	1.82	.59	.65	.14
Totals	28.10	2.05	14.14	.68

This certainly is little enough protein. If gluten feed can be had, we should prefer spending the money the oil meal would cost, for that.

IT CANNOT BE DONE.

A subscriber at Iron River, Wis. wants a formula for a balanced ration from timothy hay at $12 per ton, bran at $16 per ton, shorts at $18, and corn and oats mixed at $20 per ton. He says he wants "milk and lots of it." We advise him to get some oil meal and gluten feed, and then if he has good cows he will have "milk and lots of it."

With cows nearly fresh, we should feed about 4 lbs. of bran, 4 lbs. of gluten feed and 1 to 2 lbs. of oil meal and all the timothy hay each cow will eat up without wasting any.

A QUEBEC RATION.

What we have said above in reply to an inquiry from Wisconsin applies with equal force to an inquiry by W. M. N. of Barnston, Quebec.

AN OREGON RATION.

Please be so kind, and make up a ration for milch cows, grade Jerseys, weighing from 900 pounds to 1,100 pounds. Alsike clover hay, whole wheat chop, wheat bran, oil meal. AUGUST KOENIG.

Albany, Oregon.

We are glad to see that one man, at least, in Oregon, has got into the way of raising alsike clover. This kind of clover is especially adapted to localities where the subsoil is more or less wet, differing in this respect from the common red clover and alfalfa. We would, therefore, recommend a formula substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
18 lbs. alsike clover hay	16.25	1.51	7.65	.27
4 lbs. wheat chop	3.58	.41	2.77	.07
4 lbs. bran	3.52	.51	1.54	.12
Totals	23.35	2.42	11.96	.46

A MARYLAND RATION.

Please give me a balanced ration from the following feeds: Prime hay, clover and timothy mixed, at $10 per ton; corn and cob meal at $13 per ton, flakey wheat bran at $17 per ton, cotton seed meal at $28 per ton, corn stover at $4 per ton. C. S. C.

Mt. Airy, Md.

Subject to reservations so often mentioned in answers given to inquiries in regard to period of lactation, dairy temperament, etc., we recommend a trial of the following as the average daily allowance for a herd of milking cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay	8.53	.48	3.96	.16
10 lbs. corn stover	5.95	.17	3.24	.07
5 lbs corn and cob meal	4.45	.32	3.15	.18
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. cotton seed meal	1.94	.74	.35	.15
Totals	24.29	2.21	12.24	.68

A VERMONT RATION.

S. D. H., Waitsfield, Vt., asks for a formula for a ration for a herd of Jersey and Guernsey cows, medium size, ranging in age from two years up. He has heavily eared silage, wheat bran, cotton seed meal and number one clover and timothy hay. Bran costs $18 per ton, cotton seed meal $24 and his hay is worth $10 per ton. He says he does not know as he has any reason to feel dissatisfied with the returns, but he wants to know whether he is feeding to the best advantage. He mixes the bran and cotton seed meal, equal parts by weight, and then feeds 4 quarts of this mixture in two feeds per day.

That is the way he puts it, but we incline to the opinion that in fact, he feeds 4 quarts in the morning and the same amount at night, making 8 quarts per day; otherwise we do not see how his cows would receive sufficient protein, although we have to acknowledge that it is impossible to estimate what a quart of the mixture will weigh.

We should not want to feed these cows more than 2 lbs. of cotton seed meal per day, and if he is feeding more than that we are of the opinion that it would be better to drop off a little on the cotton seed meal and add more bran and we should suggest for a ration as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. mixed hay	8.53	.48	3.96	.16
5 lbs. bran	4.41	.63	1.93	.15
2 lbs cotton seed meal	1.84	.74	.33	.17
Totals	21.38	2.18	9 72	.66

It is quite possible that the above formula may not give any better results than he is now receiving, but we think it would be better for the cows on the whole, even though it may prove to be more expensive. At all events we consider it worth trying.

SILAGE FROM STOVER.

The same inquirer says he has a quantity of dry stover well cured, which he proposes to put into his silo when it is empty and wants to know what kind of fodder it will make. If this stover is thoroughly dried it probably can be stored in the silo and kept in that condition, but if it is a little bit damp as is apt to be the case, it would be very likely to mold and spoil. Although we have never tried the experiment personally, a good many of our readers have and have had excellent success in cutting the dry stover into a silo, wetting it pretty thoroughly as it went in and then treating it in every respect as they would corn cut direct from the field. We incline to the opinion that the chances for damage would be somewhat less in pursuing the latter course than in storing a great body of the stover in the silo, dry.

FOR A WISCONSIN MILKMAN.

Have been reading your paper with a great deal of interest and trying to figure out a ration, but cannot seem to quite satisfy myself. Wish you would formulate one from the following feeds: Ensilage, (built silo last fall from plans found in your paper) bran, $14 per ton; corn meal, $14; oil meal, $30; oats (ground), $16; mixed hay, $7 per ton. Cows have access to good straw stack and a little stover fed in yard when it is not too cold to stay out.

Am selling milk in town for 5 cents per quart, and want good flow at best profit possible. Cows about 1000 pounds. Mostly grade Jerseys, part fresh, with more to freshen during winter. F. H. G.

Ripon, Wis.

For a minimum allowance try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.53	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	82	1.94	.14
Totals	23.66	2.19	11.64	.63

If the cows are large producers, increase the grain by adding 1 lb. each of the bran and gluten feed.

WHY NOT MORE CORN MEAL AND MIDDLINGS.

A. M. W., Vermont, has grade Jersey cows fresh in milk last fall. Can buy wheat bran at $19; cotton seed meal at $25; gluten feed, $24; wheat middlings at $21, and corn meal at $19. He has mixed clover and timothy hay, Hungarian hay, fine quality of oats and barley straw, the oat part containing some peas. He concludes his inquiries with the following words: "Now you hardly ever say anything about feeding corn meal or middlings. Are they not good for a milch cow or for milk?"

Answering the last inquiry first we have to say, so far as corn meal is concerned we consider the bolted meal inferior to the ground corn; and in regard to middlings, we beg to refer this inquirer to what was said in response to C. H. W., Evergreen, New York. Further than this it might be said that in the middle west and east the great problem in feeding milch cows is to provide them with sufficient protein, and it becomes impracticable to feed very much corn meal. In the semi-arid regions of the central West where alfalfa hay is plenty, we always recommend the use of corn when it can be had, because the alfalfa furnishes an abundance of protein and the corn makes up the deficiency in carbohydrates and fat better than almost any other feed that can be selected. We therefore submit for our Vermont friend's consideration and trial, if he is so disposed, the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay	8.53	.48	3.96	.16
10 lbs. straw	9.00	.12	3.86	.08
6 lbs bran	5.29	.75	2.32	.18
2 lbs. cotton seed meal	1.84	.74	.33	.17
Totals	24.66	2 09	10.47	59

TO FATTEN A MILKMAN'S COWS.

C. H. W., Evergreen, New York, is milking twenty-four cows which he describes as of the common variety, and is selling milk to bakers and grocery stores. He has been in this business for eight years, buys his cows, milks them as long as they are profitable, wants them to be fat and then offers them to the butcher. The style of feeding heretofore has been about 40 lbs. of fresh brewers grains with 8 lbs. of a mixture composed of four parts of wheat middlings, three parts corn meal, and two parts cotton seed meal, and in addition to this he feeds about 12 lbs of clover hay per day. We estimate that he is feeding now about 27 lbs. of dry matter, in which there are 3.8 lbs. digestible protein, 12 lbs. digestible carbohydrates and something over 1 lb. digestible fat.

This seems to us more protein than these cows can profitably use, and, if anything, less carbohydrates than is desirable under the circumstances. Depending somewhat on their relative prices, we should be disposed to drop out the cotton seed meal altogether as this is high in protein and very low in carbohydrates and then feed either corn chop, that is ground corn as distinguished from corn meal, or a mixture of corn chop and wheat middlings. If the feed called middlings is genuine middlings it is a first-class feed, but so much of that which is now called middlings is simply ground over bran with a great variety of weed seeds and all the dirt and sweepings of the mill, that we hesitate to recommend their use.

BRAN AND CORN FOR HORSES.

E. S. D., Grass Lake, Mich., asks whether he can afford to feed a mixture of bran and corn meal to his horses when bran is worth 80 cents per hundred, and corn meal 72 cents per hundred. This will depend altogether upon the cost of oats. If the mixture costs less per hundred than oats, we should deem it expedient to make a trial of it, otherwise use the oats.

Personally, we are not so much averse to feeding corn to horses as most farmers are.

PEAS AND OATS FOR SOILING.

L. L. M. wants to sow six acres of rich land to supply as large an amout of protein feed as possible for his cows, part of it to be used for soiling and part for winter feeding.

We know of nothing better to recommend to him than peas and oats, using the so-called Canada field pea and one and one-half bushels of peas and same of oats per acre. For method of sowing see the answer to D. M., Zanesville, Ohio. Fit the land as early in the spring as possible, making the surface fine and mellow. Sow the peas, plow them under and afterwards sow the oats as stated in the reply to D. M. It might be well to make a trial in a small way of the Southern cow pea.

PEAS AND OATS FOR HAY.

D. M., Zanesville, Ohio, writes:

The fly has about destroyed my wheat. I think I will drill in oats and mow it for hay. Would you advise drilling in Canada peas with oats?

What kind of a scheme would it be to drop Southern cow peas in the ensilage corn? Would that help the silage?

As a rule it is not considered expedient to sow peas at the same time with oats; first, because the peas should be covered with about four inches of soil, whereas the oats need but very scanty covering. The better plan is, where it can be done, to sow the peas and plow them under, covering them about four inches deep, and then in a week or ten days, or when the peas are fairly well sprouted, to sow on oats broadcast and harrow them in.

We are quite decidedly of the opinion that there will be found some combination of peas or beans that can be planted with corn, that will materially improve the product for silage purposes, and it is probable that the so-called cow pea will be found to be well adapted for this purpose in climates where they will grow fairly well. In Canada they have used the so-called horse bean for this purpose, in an experimental way, and a few farmers have tried them for their entire crop, and with great satisfaction.

INDIANA QUERIES.

L. A. W., of Salem, Indiana, says that he has been reading the DAIRYMAN for six months, and that the more he reads, he finds the less he knows. If we did not read between the lines of this letter it might be construed as being somewhat discouraging. Of course he does not know any less now than

he did before he commenced to read the DAIRYMAN, but he has learned that there are a good many more things to learn about dairying than he once thought for. And this is really a helpful and encouraging state of mind. The man, who is wise in his own conceit, who thinks he knows so much that there is nothing more for him to learn, who has in fact gone to seed, is in a pitiful condition. There is no more growth for him, no more progress for him, and the probabilities are that his previous growth was both stunted and deformed.

L. A. W. writes that the supply of cotton-seed meal in his market, having given out, his cows (eight in number) fell from 185 lbs. per day to 137 pounds per day, in the short space of four days. He inquires, what is the quickest way to get them back? Corn is worth 35 cents per bushel; bran, $16 per ton; gluten feed, $17 per ton; and cotton seed meal, $24 per ton.

We should suppose, under the circumstances, that the best way to bring these cows back to their normal flow, would be to furnish them the cotton seed meal that they were accustomed to. If it is impracticable to do this, we would give 2 lbs. of gluten feed for each pound of cotton seed meal that the cows have been deprived of. This amount of gluten feed will furnish about 0.4 of a pound of digestible protein, whereas 1 lb. of cotton seed meal furnishes about .37 of a pound.

He asks us, moreover, which is the best shredder and cutter and power to run the same, and wants to know if there is a corn grinder for crushing corn, cob and shuck. These are questions that one man cannot answer for another. No man has had experience with all these different machines, and if he had, each possesses some merits peculiar to itself, that one man, perhaps would estimate very high and his neighbor would care little about. One should send to the manufacturers and dealers in these machines for catalogues and circulars and prices. The peculiarities of each machine are well set forth in this printed matter, and a man must judge for himself which combination will be best adapted for his own use and likely to give him the best satisfaction. For some years we used a two horse power on our farm for cutting silage, and it is still in use for cutting the corn stover and straw and hay, as it may be needed through the winter, but for filling the silo in recent years the boys seemed to have preferred to hire an engine that is owned in the neighborhood, and is used primarily for running a threshing machine.

Our advertising columns usually will give all the information necessary to enable a man to write to the parties, who are engaged in manufacturing all kinds of farm machinery and implements. We publish these advertisements primarily of course for the money which the advertisers pay us for so doing, but at the same time we think we are doing the general reader very considerable good, by placing before him information which will enable him to write to manufacturers for full particulars, and thus relieve himself from the probability of having to pay excessive profits to middle men.

A MICHIGAN PROBLEM.

Will you kindly give us a feeding ration for grade Durhams, some Holsteins and Jerseys; age ranging from two and one-half to ten years old; are making butter for private custom.

Our feed consists of finely cut corn stalks, good oat straw and wheat straw with timothy hay mixed, about one-fourth; have plenty corn and oats; have wind mill grinder. Corn and oats, $18 per ton; bran, $14 per ton; cotton seed meal, $24 per ton; old process oil meal, $1.74 per hundred. Will it pay to buy some other good milk producing feed? If so, state what it might be. W. H. B.

Ann Arbor, Michigan.

We do not consider corn and oats at $18 per ton as cheap as bran at $14, when there is first quality of roughage for the cows; but situated as this inquirer is, we suggest to him that he try feeding as an average daily allowance for his herd, 6 lbs. of bran, 3 lbs. of corn and oats, 1 lb. of cotton seed meal and 1 lb. of oil meal, with all the stover, straw and timothy hay they will eat. If some of the cows have extra dairy ability we would increase the allowance of grain by adding at least 50% to the cotton seed meal, and the same to the oil meal.

HUNGARIAN STRAW.

J D. N., of Oxford county, Ontario, inquires as to the value of Hungarian straw that has been threshed for seed, the specific inquiry being: "Will it compare favorably or otherwise with wheat straw, at the same price?" We are as much at sea on this question as our correspondent, as we can find no analysis of such material or digestion experiments with it. Unless other fodder is very scarce and dear, we should hardly think it worth $5.25 per ton, but experience might prove to the contrary, and we have no other light on the subject than such as would come from experience. If our friend tries feeding this style of straw, we would be very much obliged if he would give our readers the benefit of his experience.

SILAGE FOR BULLS.

J. C., of Lynchburg, Virginia, asks if there is a good reason for not feeding a bull on silage.

The answer is, that it is the most difficult thing in the world to "give good reasons." There is a proverb among lawyers to the effect, that many a wise judgment has been pronounced by courts, for which very unsound reasons were given. It ought to suffice in the present case to say, that experience has demonstrated that feeding silage to bulls is a very dangerous practice. Whether this results from special peculiarities in silage, or whether it is that such a feed is too carbonaceous, and contains too little protein, or just what the reason may be cannot be satisfactorily stated. What we do seem to know is, that feeds containing a good percentage of protein seem to be better in such case than those which are largely carbonaceous. This would indicate that if any grain is to be fed, it should be bran and oats and not corn, and that for roughage, clover hay would be better than corn stover or timothy hay.

AN IDAHO DAIRY.—BALANCED RATIONS.

C. H. W., of Rexburg, Idaho, writes that he has ninety head of milch cows recently purchased, with one-half of them now giving milk and many others soon to be fresh. For this herd he requests us to give him a formula for a balanced ration where the following feeds can be had, namely: Alfalfa hay ($3 50), alfalfa and timothy hay mixed one-fourth timothy ($4.00), wheat bran ($9.00), frozen wheat chop ($9.00), chopped barley ($12.00), oats ($17.50).

It is simply impossible to arrange a formula from these feeds that shall come within the definition of a balanced ration, that is, have a ratio of one part of protein to from four to seven parts of carbohydrates. This circumstance makes it opportune for us to say that we consider the mere item of nutritive ratio as having but little significance.

So long as the cows receive sufficient protein in their daily allowance to supply the demands of exercise, growth and replacing worn out and cast off matter and in addition to this furnish the material for the casein in the milk, it is our opinion largely immaterial what the specific ratio of this amount is to the carbohydrates and fat. Experience seems to have demonstrated that under ordinary circumstances about 2¼ lbs. of digestible protein will supply these requirements. If more than this is furnished, the excess is either applied to the same purpose for which the carbohydrates are specifically intended, or else it passes off as waste. There is no combination of the above named feed stuffs that will satisfy the appetite of the cow and not contain very much more digestible protein than is absolutely necessary.

We have no specific information as to the analysis of this frozen wheat. All we know about it is that it is fed to stock in Idaho, Montana and the Canadian Provinces, and is accounted a good feed. It is of course much less bulky than bran and therefore a cow can eat more of it. We would suggest for our friend's consideration and trial with the cows now in milk substantially as follows: 20 lbs. (more or less as the appetite of each cow may require) of alfalfa hay, 4 lbs. bran and 4 lbs. of the frozen wheat.

PLANS FOR CREAMERIES AND CHEESE FACTORIES.

The same inquirer asks us to refer him to a work on plans for creameries and cheese factories, together with equipments for the same.

All manufacturers of dairy machinery give in their catalogues valuable plans for creameries and cheese factories and a list of equipments for the same with varying numbers of cows. A request to them for a copy of their catalogues will be very certain to meet with a prompt response. In addition to this we would recommend our friend to purchase a copy of Gurler's American Dairying and also a copy of Decker's Cheddar Cheese Making. Both of these books can be had from this office, at $1.00 each.

A WISCONSIN FEEDING QUESTION.

F. F. F., Madison, Wis., has timothy hay, millet and shredded corn stover and in connection with this is feeding corn and cob meal to his cows. He says he would like a balanced ration but does not want to buy any more grain than necessary. He does not state in what stage of lactation his cows are, nor give any other clue that would enable us to suggest a specific formula. If we were feeding these cows and they were not too far advanced in lactation we should add gluten feed to the corn and cob meal making the mixture equal parts by weight of each, and would then feed all of this that the cows could pay for, commencing perhaps with 8 lbs. a day and increasing by 1 lb. or 2 lbs. every fifth day it the cows show a disposition to give enough more milk to pay for the extra cost. Add a little salt, about one teaspoonful, with each feed, and see to it that the cows have access to water twice a day and opportunity to drink without fear of molestation, one from another.

CREAM AND BUTTER QUESTIONS.

How much will one gallon of cream, which tests 30% of butter fat, weigh? What variations in weight would there be if the cream contained a greater or lesser amount of butter fat? What is the standard weight for milk? How many cubic inches are contained in one gallon of cream, and how many are there in milk? What per cent cream would it take to make two pounds of good marketable butter per gallon? What per cent cream would it take to make four pounds butter per gallon? W. F. G.

Pittsburg, Pa.

A gallon of 30% cream will weigh 8.34 pounds. The richer the cream the less a gallon will weigh: Thus 40% cream weighs 8.22 pounds; 20% cream, 8.46 pounds per gallon. The average weight of milk is 8.6 pounds per gallon.

They both contain the same number of cubic inches, viz., 231.

A gallon of 22% cream would make close to two pounds of butter; four pounds of butter per gallon would require 42.8% cream.

FOR A COUNTY ASYLUM HERD.

I am not a farmer, simply an agriculturalist. As superintendent I feel impelled, as a duty, to know that my farm and stock are properly, economically and intelligently handled. HOARD'S DAIRYMAN is and has been my guide. However, annually, I like to take my bearings and adjust my compass that I may guide and guard with confidence.

My herd is half registered and half grade Jersey—thirty in number. Kindly give me ration from following: Corn stover(*ad libitum*), good clover hay, roots (sugar beets, mangles, carrots, of which we have a large stock sufficient to last until spring—have used them since fall, 20 lbs. a day), bran, $13.50 per ton; linseed meal, $29.00 per ton; "Joliet" gluten (Chapin), $18.00 per ton; Have used gluten largely and am satisfied of its value. "AGRICULTURIST."

Wisconsin.

The above list of feeds affords as good an opportunity for choice as one could desire. We select from them as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay.....	8.47	.68	3.58	.17
10 lbs stover.....	5.95	.17	3.24	.07
20 lbs roots.....	2.28	.20	1.60	.02
5 lbs. bran.....	4.41	.63	1.93	.15
4 lbs. gluten feed	3.69	.82	1.94	.14
Totals.....	24.80	2.50	12.29	.53

As will be seen we use everything except linseed meal. We consider this unncessary where roots or silage are used and this more especially when it commands so high a price.

"You Never Miss the Water Till the Well Runs Dry."

So it is with health; we never realize its value until it is gone. When old time strength and vigor are wanting it is the best to look at once to the blood. Purify it by taking Hood's Sarsaparilla, and restored appetite, perfect digestion, steady nerves and even temper will prove that it is bringing back the glow of perfect health.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Strong Bones

In speaking about Scott's Emulsion for children, you should not forget that it contains ***lime*** and ***soda,*** just what the child must have to form strong bones and good teeth. It's this forming time you want to look after.

Growing bodies must have an easily digested fat. Just think how much of it there is in milk, as cream.

Scott's Emulsion

is even more easily digested than cream. It's surprising how children thrive when given it.

Don't keep the children living on the edge of sickness all the time. Make them strong and rugged, plump and hearty. Scott's Emulsion of Cod-liver Oil and the Hypophosphites of Lime and Soda will do this for them.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

TO FEED ALL THAT WILL BE PROFITABLE.

Kindly give me the best formula for butter products from new milch cows, out of the following: Can feed from 30 to 40 lbs. ensilage daily, 5 to 6 lbs. timothy hay and oat straw; wheat bran, $17.00; wheat middlings, $19.00; buckwheat middlings, $15.00, when I can get them; Buffalo gluten, $17.00 to $19.00. Can get oil meal, if an improvement, at about $25.00 per ton. I want to feed all that will be profitable. J. McM.

Dresserville, N. Y.

We like the language of the concluding sentence in the above communication. Probably all of us feel that way, but too many of us have not the courage to feed that way. If his cows have the proper dairy temperament, we see no reason why they may not make use of the full amount of the feed specified below:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
5 lbs. timothy hay	4.34	.14	2.17	.07
5 lbs oat straw	4.54	.06	1.93	.04
4 lbs. bran	3.52	.50	1.54	.12
6 lbs. buckwheat middlings	5.24	1.32	2.00	.32
Totals	25.56	2.41	11.84	.76

When it is impossible to get the buckwheat middlings, the gluten feed may be substituted in its place. We do not consider it important to use oil meal in connection with silage, and this more especially when oil meal commands the exorbitant prices which have been ruling in recent years.

SILO QUESTIONS.

I intend during the coming summer to build a stave silo 24 feet in diameter, 24 or 28 feet high.

What would be the capacity of a silo of this size?

Would a silo of this size be large enough for a herd of 60 head of cattle?

I intend to have four posts 6×6 equal distance apart, in sides, and through these would run ⅝inch iron rods as hoops. How far apart should these hoops be?

How should foundation be built?

Crookston, Minnesota. SUBSCRIBER.

A silo 24×24 feet will hold 195 tons; 24×28 feet will hold 243 tons. To winter 60 head of cattle will take 216 tons of silage. This will require a silo 24×26 feet. With a silo of this size there is always danger that it will not be fed fast enough to keep the surface in good condition, the surface of an open silo being liable to mould rapidly. For this reason it is better to build two small silos, or if the large one is already built to put a partition in it, fill up the corners, and thus, virtually, have two silos. Two single silos, to hold 216 tons of silage, should be 18×24 feet.

The bottom hoop should be about six inches from the base of the silo; the second hoop 2 feet from the first; the third 2½ feet from the second; the distance between hoops being increased until they are 3½ feet apart. This distance must be kept till near the top of the silo, when they may be 4 feet.

It is not absolutely necessary to have a special foundation, although of course the silo will last longer if a stone or cement foundation is used to support the staves. If a foundation is not used, put a few inches of well tamped clay or loam in the bottom of the silo to exclude the air.

For a foundation, build a circular stone and cement or grout wall, to set the silo on. Make the connection, between staves and foundation, tight with cement.

BONE MEAL FOR ABORTION.

In the DAIRYMAN of February 24, 1899, on page 28, Mr. F. C. Baker stated that bone meal was good for abortion. But he does not state how much to give a cow, and how often. Would you please let me know through the DAIRYMAN how to use the bone meal?

A tablespoonful of bone meal, three to five times a week, has been recommended for the above purpose. Mix it with salt and sprinkle on the feed.

POOR CHURNING—WARBLES.

What is the most practicable way of getting rid of grubs in the backs of cows?

Is there any reason why cream cannot be churned into butter at 60° F. in 45 minutes in the South? Such is the case with my butter. It will not gather at 60° in the time prescribed by the writers of the North, but at that temperature will foam and scarcely gather at all. F. L.

Commanche, Texas.

Squeeze them out with thumb and finger, and then put a few drops of tincture of myrrh and aloes into the hole.

You are probably churning at too low a temperature with, perhaps, too thin a cream. If your cows are receiving cotton seed meal, this would tend to raise the melting point of the butter fat, and so prevent the butter from coming at 60° F.

Churning temperatures are not hard and fast laws to be followed, regardless of conditions. In this respect, every dairyman must be a law unto himself, and find, by a little experiment, the conditions of tempera ature, etc., that gives him the best results. In this case you may have to churn at 65° F. or perhaps 70° F. Try and see. If your cows are strippers you may have to wash the cream before it will churn; add 2 to 3 times its volume of water to the cream, mix well and reseparate.

A NEW HAMPSHIRE RATION.

Please give me the most economical bal anced ration for cows fresh this fall; two heifers, the others two, three and four. Have plenty of silage, Sanford variety, very well eared; timothy hay, mixed with a small amount of clover. Can buy oil meal for $1.50 per cwt.; bran, $1; gluten, $1.25; corn meal, 95 cents. K. W.

Charlestown, N. H.

For a minimum allowance try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.68	.32	4.34	.15
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.83	1.94	.14
Totals	23.81	2.03	12.01	.62

If the cows will respond to a larger feed, increase either the bran or gluten feed or both, according to the capacity of the individual cow to respond.

A QUEBEC CONDITION AND INQUIRY.

Will it pay to feed cotton seed meal at $26.50 per ton, with bran, when I can buy corn meal for $17.25 per ton? Bran is my principal grain feed. I feed from 6 to 8 lbs. of bran and 2 lbs. cotton seed meal per day, in two feeds. I am feeding peas and oats, about equal parts by weight, ground with the bran, but that will be done in three weeks.

I have my bran bought for the winter at $15.50 per ton. I can buy shorts at $18 and middlings at $19 per ton.

Now, the question is, what will I buy for my cows? I make butter. I should have said that my cows get about 20 lbs. of pulped turnips each day, with the meal.

I know that I have made several hundred dollars more than I would have done if I had never seen the DAIRYMAN. R. McF.

Lenoxville, Que.

The omission to specify what kind of hay the inquirer has, makes it impossible to answer his question directly. With timothy hay he would need to use cotton seed meal to bring the protein content of his ration up to the standard, but with clover hay, corn chop will answer every purpose, as the following formula will show:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover	16.94	1.36	7.15	.34
20 lbs. turnips	1.90	.10	1 44	.04
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. corn chop	1.78	.16	1.32	.09
Totals	25.91	2.47	12.25	.65

POTATOES FOR COWS.

I have an abundance of alfalfa hay. Can raise 700 bushels of potatoes to the acre. Can buy mill feed made of wheat containing all that is left after 35 lbs. of flour has been taken out per bushel, at $12.50 per ton. How many potatoes can I afford to feed in dairying for winter butter? What amounts of these feeds would make a complete ration? A. A. B.

Oregon.

See communication from E. J. Brownell on page 962, and the answer to L. B. B., Fullerton, California.

We think 15 lbs. alfalfa hay, 20 lbs. potatoes and 8 lbs. of the mill feed would furnish a good average daily allowance. The only question is as to the effect on the grain of the resulting butter.

SAVE FEED.

Feed is fuel to the animal economy. If is burned up to supply internal heat. If it is heated (cooked) before it goes into the animal's stomach it saves that much fuel (feed).

Electric Feed Cookers save feed, save money and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. Circular and price free.

GOOD COWS AND GOOD MANAGEMENT.

Mr. J. Cooley, of New Woodstock, N. Y., is the proud possessor of a fine herd of 24 Holstein cows. The milk of these cows is taken to the New Woodstock cheese factory, and the proprietor of the same informs us that in one year, by the books of the factory, Mr. Cooley's herd earned $2,050. The average test for the herd was 4 per cent. Mr. Cooley's herd and his management of the same constitutes a very interesting object lesson to study. HOARD'S DAIRYMAN, as well as its readers, will be greatly pleased if he will give in a communication what his method of breeding, feeding and management of his herd has been. There is a startling contrast between that herd and the great mass of cows that support the cheese factories or creameries of the country. That difference is not an accident either, but it is the result of the use of intelligence. The road is open for any man to travel that wishes to.

Meeting of Short Course Alumni.

The fourth annual meeting of the Short Course Alumni, of the University of Wisconsin, will be held at Madison, Feb. 8 and 9, 1900. Room 210 Capitol building.

An Experience with Milk Fever.

The Iodide of Potash Treatment.

ED. HOARD'S DAIRYMAN:—In your issue of Jan. 5th, you ask your readers to inform you of any deaths by milk fever where the cow has been milked without drying off from one calving period to another.

We do not know of such a case. Our experience though very limited seems to point in the opposite direction. It might not be entirely out of place to give our experience in a recent case of milk fever in our herd. Before this year this cow had been milked through but this year we let her go dry some six or eight weeks previous to calving. The afternoon of the second day after calving, it was noticed that she seemed rather weak in hind legs and feet. As passages were slightly dry we gave a dose of salts, hoping to get a good passage before paralysis should come on. We got up early next morning and found her down, insensible to pain, eyes glassy and head turned to the side. My brother had taken a four year's course in agriculture at Purdue University, graduating in '98 and I had rubbed against some of the buildings during short course of '97, so we diagnosed our case as a torpid form of parturient paresis and set to work to save the cow if possible.

We were glad to note that she had not lost the power of swallowing, so we gave her ½ pint of whisky to stimulate her till we could get other medicine at town. We then hunted up the DAIRYMAN (we keep them all) of Oct. 27th, found the article in regard to the Iodide of Potash treatment for milk fever, written by the State Veterinarian of Penn., and in spite of the advice of one Jacob Price also of Penn., we followed the directions.

We secured a rubber tube and injected ½ pint 1% sol. iodide of potash into each teat, after sterilizing all articles in use. By the mouth we gave ½ pint of whisky 1½ pounds salts, 2 ounces ground ginger, ½ dram nux vomica, as a drench. Presently she had a good passage of urine, without mechanical aid, and our hopes began to rise; however, we repeated the injection into the teat in four hours, also gave another dose of whiskey in a little water.

Twenty minutes after each injection we milked the udder out thoroughly, also milked frequently during the day. Our patient seemed much improved; we retired at 9 p. m. and next morning at 4 went to her stall and found she had been up during the night and had had a good passage from the bowels. She got up and was milked as if nothing very serious had been the matter.

Have had some trouble with the udder since, but is all O. K. now. She has eaten heartily all the time, though have been very careful not to feed too much.

We used antiseptics in cleansing the udder but did not use any in the solution; think one teaspoonful salt to each pint of the solution would prevent bacteria from troubling the udder inside. If we have another case will surely use this treatment.

Have narrowly escaped milk fever several times during our three years in the dairy business, but this was our first case. Hope in the future to be able to prevent its recurrence by milking through and watching after the feed more closely.

Neighbors who do not take HOARD'S DAIRYMAN and don't believe in educating the boys that are to be farmers, would probably have split this cow's tail, put in salt and pepper, bored holes into the horns and sold the hide next day, though she makes 14 lbs. butter per week. A. J. N.

Valley Mills, Ind.

The Kansas Dairy School.

ED. HOARD'S DAIRYMAN:—The Kansas Dairy School opened up last week with 54 students, 53 gentlemen and 1 lady, Miss Schultz, daughter of the creameryman at Walnut, Kansas. Of this number about one fourth have had previous experience.

All of the students, except three, gave Kansas as their residence. Of these three, one registered from Wisconsin and two from Missouri. There are 44 students taking the creamery and 10 the cheese course.

Among the experienced creamerymen present we note Mr. R. C. Roach of Hutchinson, Kansas. Mr. Roach is outside manager for the Parker Creamery's line of 41 creameries and stations. Mr. C. C. Nichols of Great Bend, Kansas, comes from the Great Bend Creamery Company and Mr. J. C. Mannen, of Overbrook, Kansas, is with the Overbrook Creamery Association.

It is a pleasure to note the enthusiasm with which the students take hold of the work. I have heard a dozen or more asking their instructors that they be kept employed every minute of the time while here.

At present there are four patterns of cream separators at the Dairy School with two more on the way. We have now only one style of combined churn, but others will be added shortly.

The amount of milk and cream handled daily will make from 20 to 25 60-lb. tubs of butter per week and 5 30-lb. cheese. This will propably be increased within a few weeks.

In the cheese room, three styles of curd mills are to be seen, a latest pattern Sprague continuous pressure press, etc. At present the students are receiving instruction with the Marshall rennet test. Mr. H. Van-Leeuwen, formerly Instructor at the Madison, Wisconsin, and Columbia, Missouri, Dairy Schools and a practical cheese maker, is the instructor is cheese making.

The plan of work required of the students is as follows: From 9:00 o'clock a. m. until 12:20 p. m. they attend classes where the various lines of dairy work, such as buttermaking, bacteriology, feeds and feeding, breeds, and breeding of dairy cattle, etc., are taken up and discussed in detail. At 1:00 p. m. each day the students report to their instructors in the cheese, butter and testing rooms for five hours practical work along their respective lines.

In addition to the 54 dairy students there are 50 students taking the short course in

SHE QUIT COFFEE

And Got Well With the Help of Postum Food Coffee.

"I am a school girl and want to tell you what Postum Food Coffee has done for me and several of my relatives.

"The old-fashioned coffee always made me heavy and dull and gave me heartburn, with dyspepsia. When we tried Postum Food Coffee, it did not taste good, but I begged for another trial, when the directions were followed, and we found it delicious. Since that time, we have used it regularly, and I never have any trouble with the heavy feeling or dyspepsia.

"Dr. Lowrie prescribed Postum for my uncle, Mr. ————, property man of the Boston Theatre, and it worked a marvelous change in him. He quit the common coffee, and has been using Postum Food Coffee ever since. He looks better than he ever did before. His family also use it. Uncle is very strong in his praise of Postum for the good it has done him. Please do not use my signature, but you can use the statement." ————————, Worcester, Mass. The name can be furnished by the Postum Cereal Co., at Battle Creek, Mich.

DON'T NEGLECT YOUR KIDNEYS.

Weak Kidneys Caused by Over-work, by Lifting or a Strain.

It used to be considered that only urinary troubles were to be traced to the kidneys, but now modern science proves that nearly all diseases have their beginning in the disorder of these most important organs.

Now by this is not meant that you should overlook all the other organs and merely look after the kidneys.

Your other organs may need attention—but your kidneys most, because they do most.

If you are sick, do not neglect your kidneys, because as soon as they are well, they will help all the other organs to health.

The mild and immediate effect of Dr. Kilmer's Swamp-Root, the great kidney remedy, is soon realized. It stands the highest for its wonderful cures of the most distressing cases. Swamp-Root will set your whole system right, and the best proof of this is a trial.

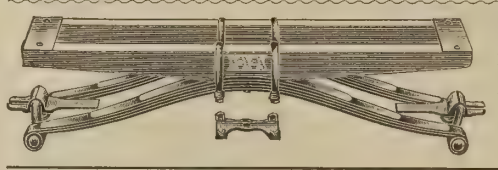
You may have a sample bottle of this famous kidney remedy sent free by mail postpaid, by which you may test its virtues for such disorders as kidney, bladder and uric acid diseases, and urinary troubles, obliged to pass water frequently night and day, smarting or irritation in passing, brick-dust or sediment in the urine, constant headache, backache, lame back, dizziness, sleeplessness, indigestion, nervousness, skin trouble, Bright's disease, neuralgia, rheumatism, bloating, irritability, worn-out feeling, lack of ambition, loss of flesh, sallow complexion.

If your water, when allowed to remain undisturbed in a glass or bottle for twenty-four hours, forms a sediment or settling or has a clowdy appearance, it is evidence that your kidneys and bladder need immediate attention.

Swamp-Root is the great discovery of the eminent kidney specialist, Dr. Kilmer, and is used in the leading hospitals; recommended by skillful physicians in their private practice; and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy for kidney and

bladder troubles that science has ever been able to compound.

If you have the slightest symptoms of kidney or bladder trouble, or if there is a trace of it in your family history, send at once to Dr. Kilmer & Co., Binghamton, N. Y., who will gladly send you by mail, immediately, without cost to you, a sample bottle of Swamp-Root and a book containing many of the thousands upon thousands of testimonial letters received from sufferers cured. Be sure to say that you read this article in HOARD'S DAIRYMAN.



If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent and one-dollar size bottles at drug stores. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root.

CREAMERY POWER must be **simple**—easy to handle; **perfectly governed**—economical in its use of steam; **safe**—well and durably made.

The JEWELL AUTOMATIC ENGINE meets these conditions and has many other good points which are best appreciated in service. It is no stranger to the trade. It is "making the wheels go round" today in many of the best managed and most profitable creameries in the country. **Note its clean lines and compact form.** We have a booklet, beautifully illustrated, which has been prepared especially for creamery people.

THE EUREKA BOILER may be used also as a **Steam Feed Cooker.** Serviceable for scalding cans, tanks etc. **Well made,** fully tested, has standard fittings and special pump for injecting feed water without lowering steam pressure. Send for catalogue describing full line. **The C. H. Dutton Co., Kalamazoo, Mich.**

Kansas Dairy School.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 19,380 pounds. Bids of 23 and 24 cents were received but all were declined and the call closed with no sales.

The quotation committee announced the market firm at 24 cents, a drop of 5 cents from last week's prices.

The sales for the corresponding week of the three preceding years were as follows:

Jan. 16, '99, 5520 lbs. of butter sold at 18½c.
Jan. 17, '98, 14040 lbs. of butter sold at 19c.
Jan. 18, '97, 26,00 lbs. of butter sold at 19½c.

The New York market was reported weak at 25 cents.

The Board of Trade unanimously adopted the following:

WHEREAS, Hon. E. S. Hanecy, of Chicago, is being put forward as a candidate for governor of Illinois on the Republican ticket, therefore be it

Resolved, That it is the sense of the Elgin Dairy Board of Trade, representing 40,000 farmers in this state, interested in dairying, that the election of a man possessing the ideas expressed by Mr. Hanecy regarding the oleomargarine question would be a disaster to this great interest, inasmuch as such views are entirely antagonistic to the farmer, who produces milk, and would absolutely prevent the pure food commission enforcing the anti-color law, such enforcement being in the hands of the governor; and be it further

Resolved, That we carefully scrutinize the records of all candidates for office and strenuously oppose the nomination or election of any one who has proven himself hostile or unfriendly to the dairy interests of this state.

H. C. B.

Elgin, Ill., Jan. 15, 1900.

California Questions.

ED. HOARD'S DAIRYMAN:—I wish I could place HOARD'S DAIRYMAN in each one of my patrons' hands and have them *study* it; as it is, I give them all of my copies.

I have received information in my business from HOARD'S DAIRYMAN, which has been worth hundreds of dollars to me, and I believe the patrons could do likewise.

A great many people think the conditions being so different here from what they are in the east, the paper is no good here. They might as well say, because a cow came from the east, she would be no good out west.

The trouble is, so many people do not adapt what they read to suit themselves and their conditions, or read carelessly, and then because of their own lack of discrimination, all reading does not prove pure gold, they discard it all as dross.

In reading the Babcock test, how should it be read, from the extreme limits of the fat column, or just the solid fat column, and why? Is there any difference of opinion on the subject?

In calculating the overrun of the churn above the test, what should the per cent overrun be figured on? On the test or the butter yield? P. A. R.

Orange Co., Cal.

The reading should be from the extreme limits of the column of fat. When read this way, it is found to correspond to the figures obtained by the gravimetric analysis. These are Dr. Babcock's directions, and no one to our knowledge, has expressed any different opinion.

Do your hguring on the weight of butter made; by so doing, you will avoid the trouble of reconciling the daily changes of the churn, with theory.

DAIRY MARKETS.

ELGIN, Ill., Jan. 15—Butter—323 tubs offered, no sales. Committee reported market firm at 24 cents.

CHICAGO, Ill., Jan. 15—Butter—Extra creamery, 25c; firsts, 23@24c; seconds, 20@22c; imitation creameries, 20@22c; dairies, choice to fancy, 22c; firsts, 20c; ladles, fine, 17@17¼c.

Cheese—Full cream, Twins, good to choice, 11½@12c; off grade, 8½@10½c; Young America, 12@12½c: Cheddars, 11½@12c; Swiss, 12¼@12½c; Limburger, 10@11c; Bricks, 10@11c.

Eggs—Strictly fresh-laid, cases returned, 17c; city cooler stock, 9@10½c; country, 5@8c.

Cattle—Good to prime native steers opened steady to strong, while other grades were weak to lower from the start. Quite a few of the best offerings sold early at steady prices, then the general market weakened and closed 10@20c lower, with 1,200@1,400 lbs. steers the weakest. The best steers offered sold at $6.40, with Hereford steers and heifers, averaging 1,325 lbs. at $6.35; corn fed western steers averaging 1,484 lbs. sold at $6.25, with 1,120@1,702 lbs. westerns at $4 20@6.10; bulk of 1,100 @1,460 lbs. natives, $5.25@6. Straight Texas steers averaging 854@1,173 lbs., $4.15@4.90; Missouri-fed Texas, 823@1,180 lbs, $4@4.80; native cows, $2.50 @4.25; heifers, $3 25@4.60; bulls, $2.90@4.35; calves, $4.50@7.60, and feeding cattle, $3.25@4.70.

Bran—Quiet, and sold at $12.25 per ton.

Shorts—Dull, with a sale of 1 car at $12.25 per ton.

MILWAUKEE, Wis., Jan. 15—Butter—Creamery, fancy prints per lb., 29@29½c; extras, 28½@29c; firsts, 26@27c; seconds, 20@23c; roll, 17@18c. Dairy selections, 20@23c; lines, 18@20c; ladles, 17@18c. There is no change in prices but the market is weak and business light, with offerings in excess of requirements; receipts, 7,332 lbs.

Cheese—American Full Cream, October Flats, 11½@12½c; November, 11@11½c; Brick, 10½@11c; Limburger, 11c; Swiss Drum, 12½@13c: Block, 13@13½c; No. 2, 10½@11c. Trade is quiet for all varieties, which are in fair supply; some winter made Brick and Limburger is making its appearance and sells 1@1½c below fall made; receipts, 3,060 lbs.

Eggs—Fresh, per doz., 16½@17c, loss off, cases returned; held, 12@14c; cold storage, 10@12½c; seconds, 8@9c as to quality. Prices are unchanged, but the market is weak except for strictly fresh; cold storage and held are dull; receipts, 87 cases.

PHILADELPHIA Pa., Jan., 15—Butter—Solid packed separator creamery, extra, 27c; firsts, 26c; seconds, 24@25c; imitation creamery, extra, 24c: firsts, 22@23c; seconds, 20c; ladle-packed, extra, 2:@23c; firsts, 21c; seconds, 18c. Print Butter—Creamery, extra, 28c; firsts, 26@27c; seconds, 23@24c.

BOSTON, Jan. 15—Butter—Creamery, extra. 28@29c; western extra, 27½c; dairy extra, 27c; imitation creamery, 23c; western ladle, 21c; print creamery, 29@30c; box creamery. 27c;

Eggs—Fancy near by, 22@23c; choice, fresh, 22c; Michigan, extra, 20c; western, 19c; fair to good, 14@17c.

ST. LOUIS, Mo., Jan. 15—Butter—Steady; creamery, 25@30c; dairy, 20@25c.

Eggs—Lower, 14½c;

KANSAS CITY, Mo,, Jan. 15—Butter—Creamery, 20@23c: dairy, 18c.

Eggs—Fresh. 14c.

CINCINNATI, O., Jan. 15—Butter—Easy, 28c.
Eggs—Quiet, 15c.
Cheese—Steady; good to prime Ohio flat, 12½.

NEWARK, N. J., Jan. 15—Butter—Market dull 25c for strictly extras; other grades accordingly. Receipts dull.

WASHINGTON, D. C., Jan. 15—Butter—Market weak. Extras, 29c; choice, firsts, 26@27c; fine imitations, 22@23c.

NEW ORLEANS, La., Jan. 15—Butter—Market quiet, buyers holding off, anticipating decline. Nominally, 27@29c.

NEW YORK, Jan. 15—Butter—Western extras, 25@26c; firsts, 24½@25c; state extras, 25c; firsts, 24@24½c.

Cheese—State, full cream, large or small, fall made, fancy, 12¾@13c.

Eggs—State Pennsylvania and Western, 20½@20c.

NEW YORK MARKET.

NEW YORK, Jan. 13—Butter—Receipts for the week, 29,837 packages. Exports for the week, 115 packages.

Heavy receipts early in the week, together with a very moderate demand, caused a flurry in the market, and a decline of 3 cents per pound on finest grades of butter. At the close, prices are very unsteady, and operators, who a week ago thought butter cheap at 30 cents, turn their backs on it at present quotations. Only creameries grading as extra were taken at top quotation, while other qualities were neglected, and go over into the next week unsold.

Hardly anything doing in June creamery; we note sale of 100 tubs early in the week at 25½ cents, but at the close, prices are nominal We quote:

Creamery, extra, 27c; medium, 25@26c; poor, 22@24c. Dairy, extra, 25@26c; medium, 22@23c; poor, 18@20c. Ladle, extra, 21@22c; medium, 19@20c; poor, 16@ 8c.

Cheese—Receipts for the week, 18,294 packages. Exports for the week, 11,113 packages.

High priced goods are not selling as good as they should at this time of the year, but as stock is steadily growing less, we look for better trade in the future. The exporters are buying low priced cheese quite freely, mostly skims at prices ranging from 6 to 9c. We quote:

Full Cream, small, extra, 12½@13c; medium, 11½@12c; poor, 10@11c. Full Cream, large, 12¼@12½c; medium, 11½@12c; poor, 10@11c.

Eggs—Receipts for the week, 49,223 cases. There was a decline of 5 cents per dozen early in the week; at the close we are having quick demand for strictly fresh eggs at quotations. All other kinds are extremely slow sale, and prices are nominal. We quote:

New York & Penn., strictly fresh, per dozen, 20@2 c; Western & Northern, strictly fresh, 19@20c; other kinds, 10@16c; Limed eggs, 13@15c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE, Md., Jan. 15—Butter—Market easy; creamery separator, extra, 30c; extra first, 28@29c; creamery first, 27@28c; creamery imitation, extra, 25@26c; Iowa & Northwestern ladle, extra, 24@25c; extra first, 22@23c; first, 20@21c; Western store packed, 20@2:c; creamery rolls (2 lbs.) 20@21c.

Eggs—Market weak; strictly fresh stock, 17c.

BALTIMORE MARKET.

BALTIMORE, Jan. 11—Butter—It is rather puzzling to so codify the various elements that go to make up the actual market, as to convey to the shipper, or other interested party, the true condition of affairs at this receiving and distributing point. The buyer is an importont element, and it is not safe to ignore him in the consideration of the subject, and it is claimed on his behalf, that the advance in prices that has recently taken place, has now reached a point that must greatly reduce consumption. This may be felt in the near future, but certain it is, that up to the present time, the accumulation of table grades is inconsiderable. Most, if not all, receivers have not had more than enough fine creamery to supply their regular trade, although they have felt compelled to exact the higher prices, which prevailing conditions appear to justify. The usual wintry defects are noticeable, but buyers are not disposed to discriminate too closely on quality. Our quotations are again advanced in order to correctly report the market. The scarcity of gathered cream butter is still remarked, and buyers are heard to wonder what has become of the favorite brands that for years have been regular in their appearance on the floors of receivers. Rather more imitation creamery and ladle packed has been coming forward, and it will find a market as soon as buyers have concluded to meet the advance in values which is necessarily imposed. Roll and storepacked are in more liberal supply; the demand, while good, is not as active as formerly.

Creamery Separator, extras, 30c; firsts, 27@28c; seconds, 25@26c. Creamery Gathered Cream, extras, 27@28c; firsts, 24@25c; seconds, 22@23c. Creamery Ohio Cream, extras, 27@28c; firsts, 24@25c; seconds, 22@23c. Creamery Imitation, extras, 25@26c; firsts, 21@22c; seconds, 20c. Iowa & N. W. Ladle, extras, 23c; firsts, 20@21c; seconds, 18c. Ohio & Indiana Ladle, extras, 21@22c; firsts, 19@20c; seconds, 17@18c. Ohio Rolls, extras, 20@21c; firsts, 18@19c; seconds, 17c. W. Va. Rolls, extras, 19c; firsts, 18c; seconds, 16@17c. Ohio & W. Va. Storepacked, extras, 18c; firsts, 17c; seconds, 15@16c. Creamery Blocks (2 lb), extras, 31@32c: firsts, 28@30c; seconds, 25@27c. Creamery Prints (½ lb.), extras, 31@32c; firsts, 29@30c; seconds, 25@27c. Md. Va. & Penna. Prints, extras, 28@30c; firsts, 23@25c; seconds, 20@22c.

Cheese—Receipts light, demand fair; market firm as quoted.

N. Y. State—Cheddars, fine, 12¾@13c; choice, 12¼@12¾c; fair, 11½@11¾c. Flats, fine, 13c; choice, 12½@12¾c; fair, 12¼@12½c. Small, fine, 13¼@13½c; choice, 13c; fair, 12½c. Ohio—Flats, fine, 12½@ 2¾c; choice, 12¼@12½c; fair, 11½@12c. Ohio Picnic, fine, 13@13¼c; choice, 12½@12¾c; fair, 11½@12¾c. Swiss Cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—The receipts so far this week have been fully ample for all trade wants; the demand, while not active, continues steady for all desirable marks at 18 cents; market weak and unsettled. 301 Exchange Place. G. M. LAMB & BRO.

LIVERPOOL, Jan. 15—Butter—Finest United States and good, nominal.

Cheese—American finest white, 57s, 6d; American finest colored, 59s.

Latest quotations for fancy creamery: Buffalo, 28c; St. Paul, 26c; Minneapolis, 27c; Detroit, 27c.

New 20th Century De Laval "ALPHA" Cream Separators.

A week ago we announced the introduction of the NEW 20th CENTURY "Alpha" De Laval Separators. The new sizes, capacities and prices are as follows:

FACTORY or CREAMERY STYLES.

Standard "Hollow-Bowl" Belt-Power,	1,300 lbs.	$ 200.—
Standard "Hollow-Bowl" Steam-Turbine,	1,300 "	225.—
"Alpha" Acme Belt-Power,	1,750 "	350.—
"Alpha" Acme Steam-Turbine,	1,750 "	375.—
"Alpha" No. 1 Belt-Power,	3,000 "	500.—
"Alpha" No. 1 Steam-Turbine,	3,000 "	525.—
"Alpha" No. 2 Belt-Power,	4,500 "	750.—
"Alpha" No. 2 Steam-Turbine,	4,500 "	800.—

"BABY" or DAIRY STYLES.

"Hollow-Bowl" "Baby" No. 1,	150 lbs.	$ 50.—
"Alpha" Strap "Humming-Bird,"	175 "	50.—
"Alpha" Crank "Humming-Bird,"	225 "	65.—
"Alpha" Iron-Stool "Baby" No. 1,	325 "	100.—
"Alpha" Iron-Stool "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 3,	850 "	200.—
"Alpha" Dairy Steam-Turbine,	850 "	225.—

Great as has been the previous superiority of the "Alpha" De Laval machines to other separators the 20th CENTURY "Alpha" developments place them above the possibilities of attempted competition from anything else in the shape of a cream separator.

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman. 44-tf

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

Having rented my farm, I offer for sale 10 full blood Holstein cows and heifers and 5 full blood calves. Also breeding bull, 2 years old, whose 15 nearest ancestors have records of more than 26 lbs. butter in 7 days. Full particulars will be given. Address, WM. HAMBLY, Belmont, Wis. 48-2

To Let—Sub-divisions of Prairie Farm, 160, 200, 300 and 400 acres, 16 miles from Toledo Separator Creamery. Silos and special butter customers. These are first-class farms, stocked with first-class cows, and none but first-class dairymen need apply. State experience and resources in application. Address, E. L. LOCKWOOD, Petersburg, Mich. 47-tf

For Sale—Dairy and outfit. Terms easy. R. A. LAMBERT & SON, Mobile, Ala. 46-tf

Buttermaker of 9 years' experience wants a steady position. Married. Will furnish good references. Work guaranteed. State wages. Address J. R., care HOARD'S DAIRYMAN. 46-tf

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476. A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis. 38-tf

Cedar Hill Jersey Farm Notes.

A Cow Stable—Water Supply—Time for Milking Cows—Poultry—Cutting Ice—Sowing Rape in Corn.

ED. HOARD'S DAIRYMAN:—We have been so very busy at Cedar Hill, the past sixty days, finishing a new addition to cow barn, and getting all buildings in good shape for cold weather, that we have not used much ink. We did intend to write up our trip to the Missouri Dairy Meeting, but press of work was too great. The Missouri meeting was a good one. I found many readers of the DAIRYMAN; met one man who had an old copy of the DAIRYMAN as far back as 1888. He has been a constant reader ever since that date.

I must give the DAIRYMAN readers a brief discription of our cow stable. The barn now is 88 feet long; new part is 30×48 feet; cows face and have a feed alley 4 feet wide, with alleys behind them, 4 feet; gutters are 8×16 inches, and one side of stable accomodates sixteen head on a platform 4 feet, 4 inches; other side holds 15 head on a 4 ft.8 inch platform. Each cow has a separate stall, doing away with any danger of teats being stepped on. The up-rights and partitions, also mangers, are oak and elm, 1 inch thick.

The barn is sided up with novelty siding, and a very heavy grade of tarred paper. Windows? Well yes, we did put in some windows. Every six feet on south side, we put in 8×10 light sash, full window size, and on north, four full windows. We also have four doors that open as double doors.

We have a pair of scales on each side of barn, and milk sheet, so our boys can weigh the milk of each half of barn with but little traveling; at one weighing place we keep a clock and thermometer. The boys record the temperature, every morning, at 5 oclock; yesterday morning the outside temperature was 10° below zero, and in the barn it was 41° above. This morning it was 10° below, outside, and 40° above in the barn.

We have seventy-seven head of Jerseys, young and old, in this barn. The old part of barn being 40 feet wide, we use a part of it for young things, calves that are being fed milk, and some larger ones. At end of barn, against it and silo, is a large, roomy lean-to that will accomodate twenty head of one and two-year-old heifers; the north half of this is lined with tarred paper.

Our water supply is drawn from a large cistern that is on high ground; pipes lead from this to horse lot, hog pens and cow barn. We have a steam pipe from boiler into this cistern and raise the temperature just where we want it. It does one good to see the cows fill themselves with this water.

My sons, the poultry manager and herd manager, whose ages are thirteen and sixteen years, have been doing some racing lately in milking; each have eight cows, and in three contests they tied in time—time 43 minutes. I saw that the cows were cleanly stripped, and the boys weighed and recorded each cow's milk. The poultry manager has milked thirteen cows in eighty minutes.

Speaking of poultry, reminds me that we are wintering 300 pullets and 200 capons These birds are in five houses, and are doing nicely for us. We give them a feed of ensilage daily, a hot mash of ground oats and dried blood; granulated bone grit and oyster shells are kept before them; and they also get cut sheaf oats and corn fodder to scratch in. Up to date, every house proves to be frost proof. They are lined with tarred paper. I think a great deal of tarred paper about farm buildings; it is a cheap and effective way of making old buildings warm.

Again the ice crop is ready for the cutting. We are very fortunate in having a fine lot of ice close to the creamery; it is only a 30-rod haul from two good ponds; the ice is now 8 inches thick and will go into our house fully 10 inches thick; our house not being quite large enough, 16×16, and 10 feet high, we got more room by going down into the ground; for drainage we took a post hole digger and sunk holes over bottom of house the depth of some 4-inch tile we had on hand. We set the tile in holes and laid a piece of board over the top; over the whole bottom of house we laid old lumber and then spread a load of old straw over all. This insures our ice to keep well.

The inquiry from Maine regarding our rape crop, reminds me that I did promise the DAIRYMAN readers a history of our success. Late last spring we sowed several patches of rape, on odd corners and patches of land around the farm, giving it no particular attention. When it was about 18 inches high, we let cows and young stock go to it; they were eager for it, and we found it would grow up whenever grazed down, if weather was favorable. It stood dry spells well, and we found it a grand thing to cut and feed our young chickens during their stay in the brooder house, while the older birds would go to the patches and help themselves. When we were ready to sow among the growing corn, a heavy wind so tangled the corn we could not get a horse in to work the ground, so did not sow any that way. My opinion is that as far north as Maine the plant sown in corn would not do well, but sown in the spring by itself, it would make pasture or a soiling crop. We shall sow a large amount, the coming season, for both.

BUFF JERSEY.

A New York Ration.

ED. HOARD'S DAIRYMAN:—What would be the very best grain rations that you could recommend from now until grass comes "irrespective of cost" for a high-class herd of registered Jersey cattle, kept for a breeding herd, the milk, however, being sold in glass bottles to city consumers? We are feeding now clover hay at noon, and ensilage morning and evening, (25 lbs. a day). Prefer to feed our grain upon the ensilage both morning and evening, unless you can suggest a better method. Please give amount in quarts, and state if for whole day or only one feeding. G. E. P.

Rochester, N. Y.

We have some doubt whether there is any necessity for feeding a breeding herd otherwise than one would feed a herd kept primarily for milk production, except that in the case of the breeding herd we would be perhaps a little more careful not to over feed; yet the cows in a breeding herd should be kept well up to their maximum profitable production. We see no good reason why a daily allowance as specified below should not produce this result:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay.....	8.47	.68	3.58	.7
25 lbs. silage.....	6.60	.33	3.50	.18
5 lbs. bran.....	4.41	.63	1.93	.15
2 lbs. corn chop.....	1.78	.16	1.33	.09
3 lbs. gluten feed.....	2.79	.61	1.45	.10
Totals.....	24.03	2.41	11.79	.69

It is to be understood that the ration is the total allowance for twenty-four hours and it is our opinion that this is better given in two feeds than in three or more.

We have specified the amounts in pounds instead of complying with our inquirer's request to state the same in quarts. Take the one item of bran for example. Some grades of bran will weigh between 30 and 40 lbs. to the bushel and others will weigh less than 20 lbs. Some grades of gluten feed are much heavier than other grades. It also makes considerable difference with the weight of a quart of feed whether it is pressed into the measure in dipping or gathered up loosely. We do not of course expect that the dairyman is going to weigh out the feed to each cow twice a day, but we think he ought, at least whenever he gets in a new lot of feed, to take pains to satisfy himself as to the weight of the different measures full, and then be governed accordingly.

Notes from the Sigworth Farm.

Winter Exposure of Dairy Herds.—Cold Water and Stables.—Keeping the Bull Confined.

ED. HOARD'S DAIRYMAN:—The poet sings of autumn days, but I think if he was a dairyman and would go up and down, throughout the land at the present time, and see the cows with backs humped, standing on the lee side of a fence or straw stack, he would change the time to winter, at least for the cow's, or owner's pocket book.

I took a trip of a half dozen miles, a few days ago, and saw six farms with cattle turned in a lot adjoining a fodder stack, eating fodder off the frozen ground, and as usual tramping over it, and the boss (they had horns on) getting the lion's share. At 4:30 p. m., on my way home, saw four of the six bunches still in the field.

The thermometer was almost at zero. During the entire day, not mentioning the injury to the cattle from freezing, those farmers lose almost one-half of their manure. But I know for a certainty that the majority of these men do not read a farm paper, and think it is necessary for a cow to have lots of exercise, and to drink ice water to cool off their systems.

I came home and went at my chores, and as the saying is, had to hustle on account of lost time, and in a little while was milking in my shirt sleeves. I have come to the conclusion that a stable in which water will freeze at any time is not fit for cows. With building and tarred paper so cheap and so easily put on, there is no excuse for cold stables. And about close confinement; my cows for six months average twenty-three hours per day in the barn, and have not had a diseased cow or lost a calf or cow for ten years.

But to keep Mr. Bull tied up so close, not only spoils potency, but renders him almost incapable of serving a cow, and to turn him out he either stands around humped up or runs off, and it is too much bother to drag in wood with him or work him, so I have hit on the expedient of, when hauling manure, to tie him behind the sled and compel him to travel back and forth to the field with me.

Ours is a dehorned Jersey and is very tame. The boys for fun sometimes ride him back and forth to water; so may fit him with a saddle and ride him for the news occasionally. Why not, they make a very easy gaited horse! I think lots of the failures of the bull's potency, result from lack of exercise. Mine is three years old and has but very few failures.

Franklin, Pa.

A New York Dairy.—What is a Fair Average?

ED. HOARD'S DAIRYMAN:—Will you give me a balanced ration from the following feeds: Clover and timothy hay, mixed (early cut); good corn silage; wheat bran, $19.00

QUAKER DAIRY FEED TESTED BY THE MILK-PAIL

Quaker Dairy Feed is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal. "Modern Dairy Feeding," sent postpaid on request. Scientific advice on feeding—FREE. SCIENCE DEPARTMENT,
THE AMERICAN CEREAL CO.,
1348 Monadnock Bldg., Chicago, Ill.

Mr. Dairyman:

Are you getting all the cream from your milk by your present method? We should like to put an

Empire Cream Separator

in your dairy and compare results. If you do not make enough extra butter to pay for it in 6 months, we will not ask you to keep it.

The Empire is as much in advance of the old style separators as the latter are of the setting system.

Six sizes of hand machines ranging in price from $40 up. Catalogue free.

U. S. Butter Extractor Co., Newark, N. J.

"HONESTY is the best policy." Nobody contradicts it.

Your dealer can get lamp-chimneys that almost never break from heat, or those that break continually. Which does he get? Which do you get?

Macbeth's "pearl top" and "pearl glass" are tough against heat; not one in a hundred breaks in use. The glass is clear as well as tough. They are accurate, uniform.

Be willing to pay more for chimneys that last till they rot, unless some accident happens to them.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

HAPGOOD PLOW CO., Box 571, Alton, Ill.
Only Plow Factory in the United States selling direct to farmer.

A Piano at a Nominal Price.

Chicago's largest music house, **Lyon & Healy**, to sharply reduce stock is offering

A New Special UPRIGHT PIANO FOR $150

Also the best stock of fine Pianos in the U.S. including Steinways, Knabes, Fischers, Sterlings, &c.,&c. We can save you upwards of $100. Easy payments. If interested do not fail to write at once. Any piano not proving exactly as represented may be returned at our expense.
LYON & HEALY, - 96 Adams St., CHICAGO.

per ton; Diamond gluten feed, $19.50 per ton.

Have plenty of oats that I can trade ton for ton for bran. Would you advise grinding the oats or trading for bran?

Cows are grade Ayrshires and of average size; have a warm barn and do not have to feed corn meal to keep them warm.

Draw my milk to factory where it is pooled; make cheese in summer and butter in spring and fall.

My cows made from January, up to date, $50.00 each. Do you call that a fair average for a dairy of 40 cows.

Cows go to a spring to drink, 10 rods from barn. Temperature of water, 49°. Do you think that too cold? B. H. TRUAX.

St. Lawrence Co., N. Y.

As compared with the general average, our friend's average would seem to be very satisfactory, but after all, averages are very deceiving. It follows as a matter of course that where his average receipts per cow were $50.00, some of the cows made much more than this, and perhaps most of them less than this. The question arises, does he know which of these cows paid him most liberally for their feed and care, and which of them paid him most scantily. It takes but little time and practically no expense to weigh the milk of each cow at every milking and make a record of it. This is what our friend ought to do, and what every dairyman ought to do, and then he will have figures at his command which will enable him to dispose of the non-profitable cows; and there are such in every herd where a record has not been kept.

Our friend is in a much better position than we are to master his inquiry, as to whether water at 49° F. is too cold. Let him watch his cows after they have been to the spring for drink. If they come away humped up and shivering it is a pretty good indication that the water is too cold, whether for the cows comfort or his profit. Further than this, the chances are that the cows go to drink but once a day. With water of this temperature they are likely to drink less than they would if the water was several degrees warmer, or than they would if they could have it before them twice a day or oftener. Would it not be possible to have a hydraulic ram to force this water into the stable and into a tank in the upper part of the stable, where it could be warmed to 60°, or thereabouts, and supplied to the cows at least twice a day in the stable?

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
We suggest for a ration, as follows:				
25 lbs. silage	6.60	.33	3.50	.18
12 lbs. hay	10.64	.58	4.75	.19
3 lbs. bran	2.64	.38	1.16	.09
5 lbs. gluten feed	4.61	.95	1.94	.12
Totals	24.49	2.24	11.35	.58

We have from another New York correspondent a statement that this Diamond gluten feed is sold under a guarantee and contains 27.33 per cent of protein. If such is the fact, the digestible protein in the above ration will be moderately increased, but not so much as to throw the ration out of proper balance.

AN URGENT APPEAL.

Mr. W. R. Wood, of Genesee county, Michigan, has an earnest and cogent way of putting things. He has been looking over the starvation returns of many of his neighbor's herds of cows. It strikes him that the only way for an earnest man of strong common sense, if he wants to influence his neighbors for their good, is to "speak right out in meeting," about this everlasting folly of keeping such a raft of poor cows.

This is how he talks to the men who are about him:

Very few farmers stop to ask themselves the question: Are my cows returning me a profit? Many are actually losing money on them every day of their lives, yet so careless are they concerning the matter that they take no pains to ascertain the facts in the case. They simply go on, year after year, feeding, milking the cows, and making the milk into butter, with no idea of how much, if any, money they are receiving for their trouble.

It is easy enough to ascertain what a cow is doing. A pair of scales and a Babcock test are within reach of the poorest farmer of us all. To weigh the milk of each animal once a week and make a test of it is not a task that requires much time, yet that alone will determine with sufficient accuracy her butter making properties.

Probably there are few herds where one or two unprofitable animals will not be found. It costs no more to feed and care for a good cow than a poor one, so why waste grain and hay on one that does not pay for her keep? Often it will be a surprise to find what was considered one of the poorest cows in the herd showing the best test and proportionately disappointing to find the favorite dropping behind some of the others; but remember that if properly manipulated the Babcock never errs. It is a detective which is unhesitatingly accurate in its decision, so do not think your preconceived ideas should have any weight, if the test shows differently. To the man with ten cows, the Babcock machine is worth the price of a cow, yes, and a good one at that. No dairyman or farmer should attempt to do business without one.

As the standard to set, each cow should make 250 lbs. of butter a year at the very least. It takes all of 200 lbs. to furnish her with food for a year. This leaves 50 lbs. only as a profit, but since the manure, skim milk, etc., are worth something we may say that the 250-pound cow will pay her keep and give a small profit.

Yet if one sets out with the determination to bring up the average above this mark, he will not find it very difficult to do it. Indeed, the possibilities of intelligent care, combined with a good cow have rarely been realized. It is something not often attained.

Farmers, dairymen, this matter is worthy your careful consideration. Do not be foolish enough to keep on year after year in the haphazard way so commonly practiced, of feeding your cows indiscriminately and pooling their milk, making and selling the butter with no idea of each animal's individual earnings. Without doubt, there are robber cows in your herd, and these are consuming the profits which the others give. Study on this question and find out "where you are at." Ferret out the unprofitable animals and dispose of them, giving the rest a chance to show what they can do. You may be surprised to find that you are getting almost as much butter as before, and with a less number of cows to feed and take care of.

"Housework is hard work without Gold Dust"

Washing Dish Cloths

Kitchen cloths must of course be washed daily, otherwise they harbor grease and odors and become unhealthy. They should be made of knit-crochet-cotton, in a square of suitable size. When you wash them, if you will add a tablespoonful of

Gold Dust Washing Powder

to the hot water it will cut the grease and clean them in half the time; dry them out in the sunshine and air.

Canadian Agents: RICHARDSON & WEBSTER, St. Marys, Ont., and S. M. BARRE, Winnipeg, Man.

Canada Praises the Reid.

Canadian creamerymen and butter-makers sing the praises of the Reid Long Spindle Separator as loudly as do their brethren of the States. Here are extracts from letters recently received from some of the most successful creamerymen in Ontario:

W. A. HUTT, Esq., Aurora, Ont., says:

"*The Reid Improved Danish Separator bought by us has been in use since May 1st, and is giving excellent satisfaction. We are skimming from 3,300 to 3,500 lbs. per hour and the amount of fat left in the skim milk is about .02 of 1 per cent. We are well pleased with the machine and would recommend it to anyone intending to buy a Separator.*"

From WILLIAM PARKINSON, Jarvis, Ont.:

"*The Reid Improved Separator surpasses the guarantee in regard to capacity and clean skimming. I am skimming 4,000 lbs. per hour at a temperature of 160 degrees, down to .02. On Mondays I skim 4,5000 lbs. per hour, down to .05 and better. It leaves the cream perfectly smooth—neither whipped nor frothy—and will skim 16,000 lbs. or more without clogging. My opinion is, the Reid is perfect in every respect.*"

BRUSE BROS., Gormley, Ont., write:

"*The Reid Separator did not leave a trace of fat in the skim milk while separating 3,900 lbs. per hour.*"

From JAS. ELLIOT, Tilsonburg, Ont.:

"*The Reid Separator works excellently and gives the best of satisfaction.*"

JAS. SCOTT, Stirling, Ont., says:

"*We are well pleased with the outfit; the Separator skims perfectly.*"

The highest awards for creamery butter at Toronto, Canada, Sept. 8, 1899, went to users of the

REID LONG SPINDLE SEPARATOR

The following is an extract from the report printed by the *Toronto Globe*:

"In creamery butter, Mr. J. C. Bell, Winchelsea Creamery, Ont., who uses the celebrated Reid Separators and Pasteurizers, was awarded first and second prizes for the best butter produced. In the butter making contest, the cream used was shipped by W. A. Hutt, Aurora, who used the Reid Improved Separator and Reid Pasteurizer, and who also took first prizes at Winnipeg and St. John, N. B."

THE NEW GUERNSEY SCALE OF POINTS.

At the late meeting of the American Guernsey Cattle Club in New York City, the committee on the revision of the scale of points, consisting of President J. M. Codman, Secretary W. H. Caldwell and W. D. Hoard, who have had the matter under consideration for a year, made the following report:

At a recent Annual Meeting of The American Guernsey Cattle Club, the undersigned were appointed to revise the Scale of Points of Excellence for the Guernsey. After carefully considering the matter, the enclosed Scale has been prepared, and is now submitted for your consideration.

It has been the endeavor of the Committee to have this scale a guide to breeders as well as for judges in the show ring. The question of the "utilty" of the animal was first considered as it was believed that upon that, more than fancy show points, rests the best future of a dairy cow. With that as a basis, the peculiarities of a Guernsey have been introduced in such manner as would encourage uniformity in the efforts of all breeders, and a guide to judges.

W. D. HOARD,
JAS. M. CODMAN, } Com.
WM. H. CALDWELL.

After considerable discussion by members of the club, the following scale was adopted, and will hereafter be considered as the Official Scale of the Club:

FOR COWS.

DAIRY TEMPERAMENT, CONSTITUTION. 38	Clean cut, lean face; strong muscular jaw; wide muzzle with wide open nostrils; full, bright eye with quiet and gentle expression; forehead long and broad	5	
	Long, thin neck with strong juncture to head; clean throat. Back bone rising well between shoulder blades; large rugged spinal processes, iudicating good development of the spinal cord	5	
	Pelvis arching and wide; rump long; wide, strong structure of spine at setting on of tail. Long, thin tail with good switch. Thin, incurving thighs	5	
	Ribs ample and fully sprung and wide apart, giv ng an open, relaxed conformation; thin, arching flank	5	
	Abdomen large and deep, with strong muscular and navel development, indicative of capacity and vitalty	15	
	Hide firm and loose, with an oily feeling and texture, but not thick	5	38
MILKING MARKS DENOTING QUANTITY OF FLOW. 10	Escutcheon wide on thighs; high and broad, with thigh ovals	2	
	Milk veins long, crooked, branching and prominent, with large wells	8	10
UDDER FORMATION. 26	Udder full in front	8	
	Udder full and well up behind	8	
	Udder of large size and capacity	4	
	Teats squarely placed and of good and even size	6	26
COLOR OF MILK. 15	Skin deep yellow in ear, on end of bone of tail, at base of horns, on udder, teats and body generally	15	15
MILKING MARKS DENOTING QUALITY OF FLOW. 6	Hoofs amber colored	2	
	Udder showing plenty of substance but not too meaty	4	6
SYMMETRY AND SIZE. 5	Color of hair, a shade of fawn with white markings. Cream colored nose. Horns amber colored, small, incurved and not coarse	3	
	SIZE FOR THE BREED—Mature animals, four years old or over, cows about 1100 lbs.	2	5
	Total		100

FOR BULLS.

DAIRY TEMPERAMENT, CONSTITUTION. 38.	Clean cut, lean face; strong sinewy jaw; wide muzzle with wide open nostrils; full, bright eye with quiet and gentle expression; forehead long and broad	5	
	Long, thin neck with strong juncture to head; clean throat. Back bone rising well between shoulder blades; large rugged spinal processes, indicating good development of the spinal cord	5	
	Pelvis arching and wide; rump long; wide, strong structure of spine at setting on of tail. Long, thin tail with good switch. Thin, incurving thighs	5	
	Ribs ample and fully sprung and wide apart, giving an open, relaxed conformation; thin, arching flank	5	
	Abdomen large and deep, with strong muscular and navel development, indicative of capacity and vitality	15	
	Hide firm and loose, with an oily feeling and texture but not thick	3	38
DAIRY PREPOTENCY. 15.	As shown by having a great deal of vigor, style, alertness, and resolute appearance	15	
RUDIMENTARIES AND MILK VEINS. 10.	Rudimentaries of good size, squarely and broadly placed in front of scrotum. Milk veins prominent	10	
COLORING OF MILK. 15.	Skin deep yellow in ear, on end of bone of tail, at base of horns and body generally. Hoofs amber colored	15	40
SYMMETRY AND SIZE. 22.	Color of hair a shade of fawn, with white markings. Cream colored nose. Horns incurved, not coarse	8	
	SIZE FOR THE BREED.—Mature animals, four years old or over, bulls about 1,600 lbs.	4	
	General appearance	10	22
	Total		100

EXPLANATORY NOTES BY COMMITTEE.

We recognize the Guernsey should be—

FIRST.....A dairy animal with a distinctive dairy temperament and conformation, having a strong, nervy structure with a corresponding flow of nervous energy, and every indicaion of capacity and vitality.

SECOND.....In color of hair, a shade of fawn, with white on limbs and under part of body is considered the prevailing markings, and some degree of uniformity is desirable.

A 6 MOS. OLD Bull Calf 56¼ Per Cent TORMENTOR Solid color, well grown, robust Dam, 22 lbs. in 7 days.
CHARTER OAK HERD. - J. P. BRADBURY, Pomeroy, Ohio.

THIRD.....One of the important distinguishing features of the breed is the presence of a yellow color in the pigment of the skin, which is indicative of rich, golden color in the milk. This is more marked in the Guernsey, and held by her to the greatest extent under all conditions of stabling and feed. The intensity of this trait varies in different animals and families, but it should be kept at the highest standard. It is fast being recognized that this color gives a superior flavor to the milk and thus to the butter.

DAIRY TEMPERAMENT.

By the "Dairy Temperament" is meant a strong, overruling pre-disposition or tendency to turn the consumption of food towards the production of milk with a high content of solids, especially butter fat, as against the constitutional tendency so often seen to turn food into flesh. Even in the strongest dairy breeds there are more or less frequent out-crops in male and female of the flesh-making temperament. To breed from such animals, while we are striving to establish a prepotent dairy temperament or tendency, is not wise. All cattle bred specifically for dairy purposes should possess a clear and decided dairy temperament, for it is that quality of character we most desire to establish, enlarge and perpetuate in the Guernsey cow.

This is especially indicated by the shape of the head (showing brain capacity), wide muzzle, open nostril, full bright eyes, feminine neck, and a construction of the back bone indicating a strong flow of nerve power and support from the brain to all of the maternal organs.

CONSTITUTION.

In breeding our domestic animals, especially for long service, like the dairy cow, it is very important that they should have abundant vital power, which we call "constitution." But "constitution" must be judged and measured by the peculiar function the animal is bred to fulfill. With the race horse the function is speed; with the steer, the laying on of flesh; with the dairy cow, the production of milk solids. In all these various functions the animal, that is to represent any one of them, must show not only large capacity in the line of that function, but also the ability to endure long and well the strain of such function, and keep in good health. Constitution is best indicated by a full development at the navel, and strong abdominal walls, showing that the animal, when in a prenatal state, was abundantly nourished by the mother, through a well developed umbilical cord.

PREPOTENCY.

In the scale for bulls, for the first time, we believe, in the history of dairy breeds, this point is introduced. The reason we have included it is that "prepotency" is the chief consideration in the selection of all male breeding animals. The pedigree and conformation is often all that can be desired but because the bull is lacking in prepotent breeding power he is an expensive failure. This quality is, in a sense, difficult to perceive or describe, but we know certain animals have it in high degree and others fail of it completely. It is fairly well indicated by vigor of appearance, strong resolute bearing, and abundant nervous energy. A dull sluggish spirit and action, we consider is indicative of a lack of true dairy prepotency, but we would prefer to breed to a rather sluggish appearing bull with first-class rudimentaries than to a stylish one with badly placed rudimentaries.

RUDIMENTARY TEATS.

We consider a well balanced and well shaped udder in the cow is largely due to the way the rudimentary teats are placed on the sire. If they are crowded close together the result is likely to be narrow pointed udders. If they are placed well apart, of good size and well forward of the scrotum, the effect, we think, will be to influence the production of well shaped udders in the resulting heifers and counteract the tendency to ill shaped udders inheritable from dams deficient in this respect. We believe the future excellence of the Guernsey cow will be greatly aided by close attention on the part of her breeders to this point.

Garbancillo (?) Poisonous to Cattle.

ED. HOARD'S DAIRYMAN:—I herewith enclose a specimen of a plant, indigenous to this climate growing in low wet places, known here as "Garbancillo," the diminutive of pea. I believe it belongs to the vetch family. My object in sending it to you is to ascertain if poisonous to cattle as claimed by the natives.

I quite recently lost a valuable Jersey cow, which had been in milk 8 months. She was taken ill and died within 48 hours. The natives declare she eat of the Garbancillo. Any information regarding the plant will be highly appreciated. J. C. RAY.

Tampico, Mex.

The above was submitted to the Department of Agriculture, Washington, D. C., and the following answer was returned:

The name, Garbancillo, is really a misnomer, for the plant is not really a representative of the pea family, but a specimen of Euphorbia. The species of this genus are very numerous in Mexico and are very difficult of identification. The specimens sent are very fragmentary and it has therefore been found impossible to name the species.

The Euphorbia are all more or less poisonous.

In addition to what is said there I might say that a case of cattle poisoning was reported to me against a species of spurge very similar to the one which you have sent. I have no doubt that the species sent may have caused the death of your correspondent's cow. V. K. CHESNUT.

U. S. Department of Agriculture.

Silage Spoiling.

ED. HOARD'S DAIRYMAN:—I send you my fourth dollar for another year's course of dairy study, the cheapest information I can get for the money.

Having built me silo this summer and used it for the first time, I would like to know what caused the spoilt silage around the outside. The silo is the round stave pattern made of fir timber, the greatest timber to shrink and swell there is, except Michigan basswood. The silo is thirteen by twenty-four feet high with nine half inch round iron hoops; the staves are 2×6×24 feet, and rest on a brick wall laid in cement and top of wall even with top of ground. The silage rests on the ground. I banked up against the staves with clay, I tightened hoops before filling pretty tight, I thought as the washers drew into the wood, and filled with whole oats and one load of corn, filling about half full by hand and the rest with hay fork. The silage in the center is all right except the outside which is kind of dry, mouldy and some rotten like manure or old rotten straw. I sometimes think it wasn't tramped enough around the outside but that's where I did all my tramping, so don't know what to think about it. The joints were so tight on some of the staves that you could not tell them from the grain in the wood. I had to loosen the two bottom hoops twice and then the washers were drawn in to the wood a quarter of an inch. This is the first stave silo in this part of the county, so of course there are a good many watching it to see whether it is a success. I expect to put in whole clover or oats next year and give it more tramping, and also coal tar it on the inside and cement it on the bottom, if you think it a good plan. Would cement up on the side of staves but am afraid the swelling of the staves would crack the cement. I would like the opinion of some of the readers who have had experience with whole clover or oats for silage, as they grow to perfection in Oregon. Can grow good corn but don't mature early enough to be sure every year, the frost cut it when the kernels were starting to form this year. Success go with you into the new year. H. V. W.

Washington, Co., Oregon.

The reasons for spoilt silage are numerous but in this case it is probable that the oats caused the trouble.

None of the hollow stalked grains can be used for silage. They contain so much air and pack so poorly that they are liable to mold and spoil in spite of all the care, possible. If corn does not mature, it may be necessary to fall back on clover, alfalfa or some other crop particularly suited to Oregon conditions.

It would be of no advantage to cement the inside of a stave silo, as the constant shrinking and swelling would cause it to check off.

Are You a Cog?

If you are a workman or a clerk, and feel that you are like a cog in a wheel, going always but making no progress, write and learn how to prepare yourself for a really desirable position.

Change Your Occupation

We give complete courses by mail in **Electrical, Mechanical** or **Steam Engineering, Architectural or Mechanical Drawing, Surveying, Civil Engineering,** etc. We will advise you free.

Dairy Straws from Ohio.

Ohio Jerseys—Effect of Oleo on Dairying—The Ohio Dairy School—Breeding up the Dairy Herd.

ED. HOARD'S DAIRYMAN:—I have just returned home from a two week's travel in Ohio at farmer's institutes. The work starts in with great interest and success, if packed houses are any indication of the people's appreciation of these gatherings. Southern Ohio cares little for dairy interests except an occasional herd located near the larger cities along the Ohio river. Only recently one of the leading Jersey herds was dispersed near Pomeroy, owned by Judge Bradbury, containing some of the best bred animals that mark the identity of the St. Lambert family.

These cattle found buyers from a great many states where great benefit must naturally come from the introduction of such excellent blood, into different herds.

It was with much regret that we noticed the neglect of dairy pursuits in this portion of Ohio. Likely some of the chief discouragements come from the fact that the cities there are less populous and we might add not so thriving as those elsewhere in the state. These conditions, more or less, effect our dairy markets and with little encouragement to foster the industry, it has fallen greatly into disrepute. I am persuaded that Ohio is not holding her own as a dairy state but giving back somewhat from the reputation she had some years ago. It is quite seldom that we strike a section in institute work that has a booming dairy business

The fact that Columbus and Cleveland have extensive oleo factories located in them, which make about 2,500,000 lbs. each of that material, colored and tinted to imitate he very finest creamery made in the state, has doubtless much to do with the present state of affairs. The aggressiveness with which these factories push their imitations into towns and cities to the detriment of good butter, is amazing.

While we think what Prof. Henry has to say in condemnation of the diluting system for raising cream is the truth, and should be discouraged, we are sure that even that system is improving much of our farmer's butter. Improved from the fact that less bad odors, dirt and dust get into the milk. That induces them to care a little better for their cows and stables, resulting, we think, in a general improvement over their old careless way of setting their milk.

Sooner or later they will find that there is a better way to make a better grade of butter, and will adopt it, wondering why they did not see the light of another day earlier in their dairy work.

It always seems strange that hotels and boarding houses do not purchase their supply of butter from those who make a good article, and hold it uniform, instead of getting the poorest of quality, simply because it can be gotten cheap.

There is little doubt but that they save in two ways, from the small quantity consumed, and in the cheaper cost of the product, but on the other hand would it not be money in their pockets, if the house had a reputation for using a fine quality of dairy butter on their tables. I know of hotels that have a "Rep" all over the state for having everything "just right," and traveling men, if at all near at hand, make a break there to spend Sunday, and even have to secure rooms by telegraph.

If there is anything that disgusts a traveler, it is to find every article of the dairy kind, from the skim milk to the cheese, clear off, and he certainly succeds in getting his disappointment satisfied.

The Dairy School connected with the Ohio State University, at Columbus, has been doing good work towards improving work in certain circles, but it is difficult to reach those who need instruction most. The Dairy School, through Prof. Thos. F. Hunt, Dean, has the services of Prof. J. W. Decker, of Wisconsin, to superintend the work at the Dairy School, with an equipment for work that is unexcelled. Prof. Decker will be reinforced by Profs. Herrick, Cronner and Smith in the dairy department, all men well equipped to instruct the students, who come there to get a scientific knowledge of dairy work.

While we are persuaded that the student, who gets through the dairy school, is by no means prepared to take up the work of either a dairy or a creamery alone, from what he may learn in so short a period, yet the knowledge secured will greatly advance him in the taking up the work rapidly afterward. While theory is provident in its measures, looking toward improvement, it is not by any means a practical demonstration of actual work.

From this very fact there are hundreds of co-operative factories over our state, that are isolated monuments of inexperience, and incompetency, and which were launched out under the colors of theoretical practices, managed by those who had little schooling in the art of handling dairy products along with young graduates from dairy schools; the latter having no experience, except what was obtained under instructors, and that under the most favorable circumstances.

To prove our position, we point out the French Bros., of Cincinnati, with their wonderful dairy interests, establishing every year more or less factories, or skimming stations in the locality of Cincinnati. They pay to their patrons within two cents of Elgin quotations for butter fat, and return back, over 80% of each farmer's weight of milk, in skim milk.

One of the causes that make patrons complain, when there is complaint, comes from the lack of strong milking cows that will test high, and these gentlemen are always desirous that such patrons should obtain good cows, either by purchase or by breeding. It is certainly obvious to all concerned, that poor cows are a vexation to their owner, and when displaced, great care should be exercised in replacing them with ones that will give a goodly mess of milk, rich in fats, and that hold out well through their milking year.

We have always maintained that no surer and quicker means can be employed to secure such results, than to head the best part of a herd of dairy cows, with a bull from a herd of butter producers, with a line of dams on both sides that have been producers. With such a sire, progeny can be produced that will respond with a 25% improvement over the cows on which he may be bred, at a very small investment, as compared with such value received.

Where this idea has been introduced for a few years, patrons have realized to a positive degree that it does pay, and are endeavoring, by the swiftest means possible, to accomplish an improvement that means more cash for the feed consumed, and, later, spent in performing such a miracle or transformation.

So many dairymen here, are endeavoring to hold fast to the beef idea, since beef cattle are in demand, but their efforts are disproving their ability to get results out of such cattle, failing to measure their value out in either class.

They never have and never will, and when they cease their senseless mixing of opposing factors in their business, then Ohio will come more into line again in her dairy acquirements.

GEO. E. SCOTT.

Ohio.

Dairy Items From Abroad, and Comments.

Cow Testing Societies in Denmark.

ED. HOARD'S DAIRYMAN:—These societies, which for some years have been spreading rapidly through Jutland, are now also making headway in Seeland, according to "*Ugeskrift for Landmand*," as many as twenty-seven such societies are now being started in that island. In order to secure a uniform system for testing, which beside other advantages, especially makes it possible to arrive at a comparison of the results reached by the various societies, the directors of these, officials of cattle breeding societies and members of the Seeland Agricultural society were invited to a meeting in Copenhagen for the discussion of this important question.

THE LARGEST CREAMERY IN DENMARK

will soon begin operations. Thus far the average Danish co-operative creameries have been erected and furnished at a cost of about $5,000.00; this new establishment will, when finished, cost about $65,000.00. This factory is arranged both for butter and cheese making and is located in a small town, Hasleo on Seeland (which is the island on which Copenhagen is located). To begin with, the milk is secured from 16 large estates

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

IT'S AS GOOD AS ANY AND BETTER THAN MANY.

ALDERNEY BUTTER COLOR

Acknowledged by All who use it to be

F. B. MILLS, Box 111 Rosehill- Onondaga Co., N. Y.

with about 3500 cows, which either send the whole milk or only the cream; it is expected that soon 10 more estates will join. The skimming of the milk will be done by 4 large separators; the daily running expenses are estimated at $55.00.

The salary of the business manager will be $1,300.00 a year besides percentage on proceeds; a boss buttermaker's salary, $1200; a boss cheese maker's salary, $900.00; and an engineer's salary, $450.00. The "lockout" of working men in Denmark has delayed the starting of the business. This factory will not merely be the largest in Denmark, but every effort will be made to make it a model in every direction, in order to attract the attention of professional dairymen beyond the borders of this country. As to the salaries and expenses mentioned, we must keep in mind that all living is much cheaper in Denmark than here.

DAIRY CONGRESS IN RUSSIA.

During the Russian dairy exhibition in September at St. Petersburg, a congress was held at which the director for commerce and manufacture, W. J. Kowalewski, made an address in which he showed by what means the great dairy industry of that country should be pushed forward. As at present the general condition of the Russian populace is very unfortunate, the only means is a foreign outlet.

The congress arrived at the following conclusions: 1. That co-operative creameries should be established. 2. That societies for the sale of dairy products should be organized. 3. That exchanges for dairy products should be opened in various cities. 4. That periodically dairy conferences should be held and other means adopted in the interest of the dairy industry and the traffic in dairy products.

Some of our dairymen may say, what do we care what Russia does? Well, we may care a good deal after awhile. Russia will yet be a great competitor in the world's, and especially Great Britain's, market and it is well enough to keep our eyes open for what progress they make. When I made "Parisians" butter in Finland 25 years ago, the only fine butter used in St. Petersburg came from Finland. Now not only has Finland to export its butter to England, but Russia itself is a considerable exporter. When these conservative, despotic countries, make up their mind to make a move in any direction, whether it be a railroad from Moscow to Vladivostok on the Pacific coast, or the export of butter and cheese to England, they move sure enough—alas, a good deal faster than our democratic government can make things move here.

NUMBER OF COWS TO HUNDRED INHABITANTS.

In Denmark we find 45 cows to 100 people, in Finland 40, in Canada 38, in Sweden 35, in Norway 34, in Switzerland 22, in United States 21, in Germany 20, in Austria Hungary 18, in Holland 18, in France 17 and in Russia 11; Spain, Greece and Italy have a still smaller number. And if it were not for the comparatively advanced state of dairying in Finland and the Baltic provinces, Russia's average would be considerably less.

J. MOLDENHAWER.

Washington, D. C.

Effort to Pardon Wilkins.

With characteristic impudence, the oleomargarine interests of this country have set about to endeavor to undo the work of the courts which sentenced Joseph Wilkins to six months in penitentiary and $1,500 fine for removing the oleomargarine stamps from a shipment of the goods, which he was preparing to sell as butter in his house at Washington.

Wilkins and his clerk were caught redhanded at Philadelphia in this act, and so far as has ever been brought to light, there are no mitigating circumstances. It was simply an act of fraud, made crime by the law of 1886, which up to this time had never been enforced as to jail sentences, but violators had been permitted to come up and compromise by paying a penalty fixed by the revenue department when the officials of the latter chanced to stumble upon violations.

It is scarcely probable that President Mc Kinley will listen to this plea of these outlaws. It would be one of the worst political moves that he could make, and at this time in particular would be unfortunate for him and his party. The farmers in the United States are in no frame of mind to have their interests sacrificed in such manner and would not hesitate a minute to make an issue of such an unwarranted use of executive clemency.—*Chicago Produce.*

To Keep the Shredded Corn Fodder from Heating.

ED. HOARD'S DAIRYMAN:—No subject is more important for the farmers in this latitude than the care and use of corn stover. Anything bearing on this must be useful. I therefore wish to tell your readers of a cheap and simple, yet very useful device for preventing husked fodder from heating.

Yesterday I visited a friend, who had his corn husked and shredded by a traveling husker. Although the fodder was by no means dry when put in the mow, it is now perfectly bright and sweet. My friend packs his shredded fodder as closely as possible in his mow. Finding after a day or two that it began to heat, he went to his forge and made himself a sort of harpoon out of ⅜-inch rod iron, a sketch of which I send herewith.

HARPOON FOR VENTILATING SHREDDED FODDER.

This he plunged into the mow as far as he could reach and drew it out, thus pulling out a few handfuls of fodder and making a vent or air hole into the mow. He did this repeatedly until the heat went down, which only took an hour or two. Anyone can make such a tool in a few minutes if he has a forge, as every farmer ought to have; if not, a blacksmith will make it for a few cents.

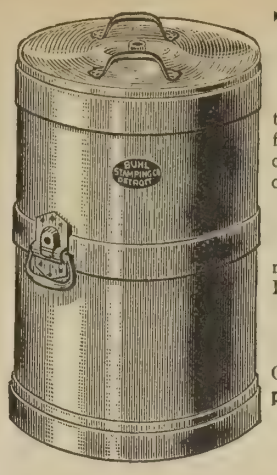
This device may be a very old one, at any rate it is new to me, and my friend thinks it is an original idea, and that it has saved his fodder, which otherwise would soon have become musty.

In this section our hay crop was poor, and we depend largely on corn hay for horses as well as cattle. We believe it is the best and cheapest roughage for stock of every kind. Hence the importance of any plan to save it in good shape.

Allen Co., Ind. ALEXANDER JOHNSON.

A Happy Mother

Frolicking with her baby makes one of the prettiest spectacles ever seen in the home. But nothing is sadder to see than the unhappy mother, weak and nervous, striving in vain to hush the cries of her weak and nervous babe. There can be no happiness for either mother or child without health. Doctor Pierce's Favorite Prescription "has done wonders" for many a woman, by restoring her health and opening for her the way to happy motherhood. This really wonderful medicine is not a cure-all. It is a preparation specially designed to cure diseases peculiar to women. It dries debilitating drains, heals inflammation and ulceration, cures female weakness, and removes the causes which generally make women nervous and sleepless.



There is no alcohol in "Favorite Prescription" and it contains no opium, cocaine or other narcotic.

Mrs. James W. Blacker, of 629 Catherine Street, Syracuse, N. Y., writes: "Your medicines have done wonders for me. For years my health was very poor; I had four miscarriages, but since taking Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery,' I have much better health, and now I have a fine healthy baby."

Use Dr. Pierce's Pleasant Pellets with "Favorite Prescription" if the bowels are inactive or irregular.

The Best Factory Cans.

The strong points of the Buhl Milk Cans are their great strength, heavy coating of pure tin, and fine finish. They do not rust like common cans, have no crevices inside, will not leak, and need no repairs. No other cans have the Genuine Heisey Side Handles.

Look for the Milk Can Trademark.

This can has 3 welded, tinned, wrought-iron hoops, tinned malleable side handles, and heavy XXXX genuine Cookley K cylinders. Capacity, 15, 20, 30, 40, and 50 gallons.

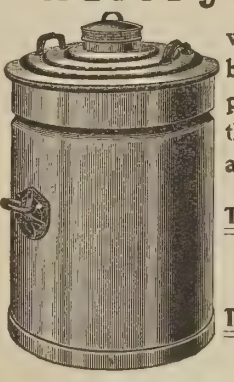
Refuse Imitations.

We make all patterns and sizes of Factory and R. R. Milk Cans, and will gladly mail you our hand-book free. **We make prompt shipment.**

The Buhl Stamping Co.,
DETROIT, MICH.

TO BUY at the right price, go to headquarters. Operating my own tin plate works, with an output of . . .

1000 MILK CANS



per day, comprising the various patterns used throughout the country, puts me in a position to interest you.

No Creamery or Cheese Factory

should be without a copy of my 1900 handsomely illustrated catalogue, *which may be had for the asking.*

FRANK STURGES,
Successor to THE CHICAGO STAMPING CO. **CHICAGO.**

Factorymen

who guarantee their cheese and butter, should see to it that their patrons are supplied with cans that can be kept absolutely clean and easily inspected.

The EMPIRE STATE CAN is the best because it is ventilated, and the milk cannot slop out.

The UNION CAN is the best old style Factory Can. Send for special circular and price list.

Air Churns.

[Press Bulletin.]

Much is being done at the present time to induce the small dairyman either to buy or take the agency for some form of air churn, or other similar device, for which great things are claimed as to butter making capacity.

The writer, and heads of dairy departments in other institutions, have received frequent letters in regard to these dairy wonders, and this occasion is taken to state a few facts concerning them.

The value of any churn is dependent upon its simplicity and durability, upon the completeness with which it does its work, upon the power required to operate it, and upon the ease of cleaning it after the butter is removed.

Although there have been, it is claimed, more patents granted for churns than for any other single agricultural implement, with the possible exception of farm gates, nevertheless it is a fact that just as much and just as good butter can be made with the old-fashioned dash churn, as with the most modern churn known.

The principle of all churns is the same whether they are dash churns or the so-called air churns, and it should be remembered that no churn can get more butter from a given amount of milk or cream than it contains of butter fat plus a reasonable amount of water and caseous matter.

The writer has made a number of tests with a so-called air churn, and while butter of an excellent quality was produced at a low temperature in a remarkably short period of time, the labor required to operate the churn was so great as to render it practically useless in day after day, dairy work. If the same amount of agitation could have been produced in a dash or box churn, the butter would doubtless have come as quickly and in as fine condition as it did with the air churn.

While the various air churns and separator churns doubtless have certain desirable qualities, the reader must bear in mind that they possess no new principle and that they will not yield more butter than the cream contains. It is recommended that these churns be purchased only on trial of at least two or three weeks and after a comparison of price with other standard dairy churns.

A Pointer.

C. A. B. S., ——— county, Cal., writes us in a post-script as follows:

Stick to your pelvic arch theory and your Babcock doctrine and tell the *Jersey Bulletin* that I said to him to give it up, because he is whipped.

From An Ohio Dairyman.

ED. HOARD'S DAIRYMAN:—I am again almost at a loss to know what to do, the past summer has taught me that a silo is almost indespensable.

This being my first year in the milk business, I sell milk at 10 cents per gallon by the year, keep 15 cows and would like to have a silo but do not feel able to build one, after buying about 10 head of cows and building a stable with cement floors. Next summer I expect to put in some corn expressly to cut through July and August, but would like very much to have a silo for next winter. We are not troubled to raise 100 bushels of corn to the acre, but some way hay does not grow well here, the soil is rather gravelly.

Would you advise me to borrow money to build the silo? Have timber in the woods.

What would be the cost of a silo sufficient to feed 15 cows? I want it big enough to feed the horses some, at least once a day. We keep 4 horses.

How many acres would it take to fill the silo?

I have been a subscriber of your paper for the last six months and find it a great help. If every reader would practice what he reads, it would not be long until they would be much better farmers. R. E. F.

N. Kingsville, O.

The DAIRYMAN cannot attempt to decide on the question of borrowing money. The conditions which make such a course profitable or otherwise, can only be known to the inquirer and certainly cannot be judged by a stranger.

To feed 15 cows a silo 15×19 will be required containing 54 tons of silage, and if you wish to feed a small quantity to horses, make the silo 3 or 4 feet deeper. It is better to have a little silage left over than to have a shortage and a consequent falling off in milk. The cost would depend on local prices of lumber which we cannot furnish. Your local dealer in lumber ought to be able to give you figures.

CONCERNING OUR ADVERTISERS.

RAPE, 25 CENTS A TON.

Greatest food on earth for sheep, cattle and swine. Salzer's catalogue tells also about Million Dollar Potato, and is mailed you with ten farm seed samples for 10 cents postage. John A. Salzer Seed Co., La Crosse, Wis.

IN THE LAND OF THE PHAROAHS.

As Rome was accounted to be the Mother of Nations, so was Egypt the Mother of Agriculture. In the wide out spreading and fertile valley of the Nile, agriculture attained under the regime of the Pharoahs the first great impetus which has kept it ever to the fore, as the leading and most congenial occupation of mankind. No pictured or written story of this land and these people is complete without reference to their agriculture. The most ardently worshiped gods were those who were supposed to exercise a patent spell, a quickening, as it were, over the growing crops. These things being true it is most fitting that S. L. Allen & Co. of Philadelphia, Pa., should devote the first page of their new 1900 Planet, Jr, catalogue to splendid views of the Nile and far-off Egypt. And, by the way, this brings to mind that we have never seeh a more artistic or comprehensive catalogue than the one just referred to. Of course it contains cuts and complete descriptive matter of the entire line of Planet, Jr., garden and farm tools, calling special attention to improvements and additions made to the line during the year. But, more than this, and of deepest interest, it gives sixteen full page reproductions from original photographs taken in this country and many foreign lands, showing the Planet, Jrs. in actual garden and field operation. The book, therefore, gives not only a comprehensive view of the merits of the tools, but introduces the reader to new and novel scenes of people, places and methods.

Can you imagine a camel harnessed to a cultivator or horse hoe; or a yoke of cattle at the same work in the valley of the Nile; or a single ox at work among the vineclad hills of France, or the famous Clydesdales of Scotland in a potato field; orrchard cultivation in fruit laden New Zealand; or a pastoral scene from antipodean Auslralia? Well, it contains all these and infinitely more. Allen & Co. have put out an edition of 350,000 of this splendid book, and it would seem that they had enough to "go round," but to make sure of getting a copy you had better write them at once. The book is mailed free to all inquirers. Kindly mention our paper in writing.

The following letter recounts recent sales from the old Homestead Guernsey herd at Perry, O., owned by L. V. Axtell and a rather interesting though short report of Mr. Axtell's recent visit to some of the "richly kept" farms near Baltimore:

ED. HOARD'S DAIRYMAN:—I think I shall soon be obliged to withdraw my card for Guernsey cattle, as our fall sales have been the largest in our experience, and the increase of our herd is about gone, for which I desire to give HOARD'S DAIRYMAN a large share of credit, and as one of my friends has suggested mention of our transactions in Guernsey cattle, in that leading journal, I shall be pleased, if space will permit, to give an account of our recent sales.

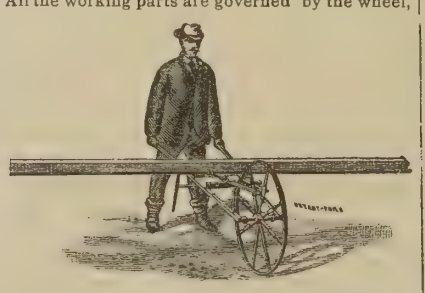
To Helen M. Sweet, of Oshkosh, Wisconsin, four registered Guernseys, a yearling bull and three fine heifers. The bull and two of the heifers were members of our exhibition herd, and were 1st and 2nd prize winners in '99. One yearling heifer to M. J. Shered, of Glendale, Michigan, very promising. To Oakwood Farm & Garden Co, Oil City, Pennsylvania, one bull 11 months old, a prize winner, and two fine three-year-old cows. To Robert G. Shaw, of Greenwood, Virgina, one bull 9 months old, whose dam was a first prize winner as yearling, and two-year-old. To A. P. Haskell, one bull 4 months old, a coming winner. To T. Edward Hambleton, of Lutherville, Maryland; the two-year-old bull "Butter Boy of Homestead," last year's 1st prize yearling at Ohio, Indiana, Illinois and Wisconsin state fairs, and two very fine heifers. To Henry A. Pair. of Lutherville, Maryland, the 12 month's bull "Red Oak of Homestead." This bull is worthy of especial mention, and was selected by Mr. Thos. J. Lea, the successful manager of Mr. Parr's extensive estates near Baltimore, Maryland, with especial reference to prepotent qualifications of his dam "Mariam Perry" for the year following his birth. This five-year-old cow gave in ten months, a yield approximated by semi monthly tests of almost 10.000 pounds of milk and over 500 pounds of butter, dropping another bull calf in exactly eleven months. I should be glad did space permit to give an account of what I observed among the herds of the breeders whom I visited on my last trip east. I will say that the prices obtained for milk and cream by the leading dairymen in the vicinity of Baltimore, Philadelphia and Washington, D. C., are enough to make a western man "die of envy."

Mr. Parr's milk brings 18 cents per gallon net and his dairy of 90 cows produces about 200 gallons per day

His cows are comfortably housed in a $25,000 barn, and in all departments of his farming business Mr. Lea has the management of about 20 men. Among other well equipped dairy plants which I visited were those of Mr. James Councilman at Mt. Wilson, Md.

A very large dairy of Guernseys and Jerseys may be found here at "Woodhome Farm"—two of the best of which Mr. C. informs me were bred at "Old Homestead Farm."

Mr. Councilman has a village all his own, consisting of about a score of pretty cottages, which he rents to the "summer boarder" class from the city.



Probably Mr. Shumaker leads all the dairymen in the vicinity of Baltimore for exactness of method. His stables are flushed and disinfected every day. The stable men wear white duck suits at milking time. The milk is all sterilized and bottled, and is used almost exclusively for rearing the infants of the wealthy. This milk nets Mr. Shumaker 32 cents per gallon at the farm. I understand T. Edw. Hambleton, the Baltimore banker, who has recently manifested a decided intention of making his dairy as good as the best and has been adding some very fine Guernseys to his herd, has a well equipped farm of 300 or 400 acres, in the middle of which ½ a mile from the highway, but on an eminence commanding a view of the country for miles, around, stands the palatial residence in which he lives, said to have cost $100,000. In addltion to superintending his extensive banking interests, Mr. Hambleton finds time to personally manage his farm, in which he takes evident pride and delight L. V. AXTELL.

Old Homestead Farm, Perry, O.

ILLUSTRATION.

BROADCAST SEEDING.

There is no question in the minds of practical hay and grass growers of the manifold advantages of broadcast seeding. In every instance where careful experiments have been made a better stand of grass has been secured from broadcast sowing than from drilling. Fortunately, too, a good broadcast seeder can be procured which does the work in a thoroughly satisfactory manner. Since 1880 the Thompson Wheelbarrow Seeders have been on the market constantly growing in favor, both in America and abroad. This seeder is a sample machine, sold at a low price, and can be used by anyone who can wheel a barrow. It sows all kind of seed on any kind of soil, in any kind of weather, any amount to the acre, with absolute accuracy and evenness. All the working parts are governed by the wheel,

and there are no cogs or intricate machinery, to get out of order. Among its special advantages is the fact that the hopper is carried close to the ground and as the seed falls direct from the hopper to the ground it cannot be carried away by the wind. You are thus enabled to sow your grass seed when the conditions of the soil are right, without any interference from the wind. Different hoppers are provided for different varieties of seeds, so that everything can be sown from chaffy red top and orchard grass, up to wheat and oats. The seeders are well made of the best material and are giving many thousand farmers perfect satisfaction. We advise our readers to send for a free catalogue describing the machine in detail. Address, O. E. Thompson & Sons, Ypsilanti, Mich., and mention this paper.

The World Cannot Show Its Equal

In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

JOHN A. SALZER SEED CO., LA CROSSE, WIS.

THE BADGER

Is Known Wherever the Best Seeders are in Demand.....

As a proof of its durability we can point to seeders sold 21 years ago still doing good work. It has an effective spring hoe which automatically adjusts itself to rough and uneven ground, a continuous steel frame, steel drag bars and every practical improvement essential to ease of operation, strength, durability and effective working qualities.

APPLETON MANFG. CO.,
35 Fargo St. BATAVIA, ILL.

Cordova Wax Candles

Nothing else adds so much to the charm of the drawing room or boudoir as the softly radiant light from CORDOVA Candles. Nothing will contribute more to the artistic success of the luncheon, tea or dinner. The best decorative candles for the simplest or the most elaborate function—for cottage or mansion. Made in all colors and the most delicate tints by STANDARD OIL CO. and sold everywhere.

40 Bu. BASKETS

ear corn an hour with the OTIS BALL BEARING MILL—burrs are 25 in. in diameter. Wt. 603 lbs. WE CLAIM it has the greatest capacity by ⅓ of any two-horse sweep mill on earth. BEST MADE is a claim made by ⅞ of the manufacturers without any reason or offering any positive proof.

YOU SHOULD BE THE JUDGE

WE BACK UP OUR CLAIM by shipping our mill to you ON TRIAL in competition with all so called Best Made mills. If the OTIS NO. 2 don't grind ⅓ more than any 2-horse mill you put it against, return it to us and we will pay the freight both ways.

WE BAR NO MILL—this offer open to the world. Order all mills made. Try them and keep the one that is the best. Our 336 page book, describing 63 kinds of grinders SENT FREE! Send at once for our trial terms.

Marvin Smith Co., 54 N. Jefferson St., O. 18 Chicago, Ills.

IN THE NICK OF TIME.

For best results seed must be planted at one time—all in one day, or before conditions change. This means even germination, all plants of the same size—a positive advantage in cultivation. The "PLANET JR." No. 4 Combined Seeder and Wheel Hoe meets all requirements. Sows in drills or drops in hills at any distance. Opens the drills, sows, covers, rolls and marks the next row at one operation. By slight and quick change it becomes a hoe, cultivator, rake or plow, throwing dirt to or from rows. It isn't a toy or plaything, but a strong, well made, durable tool of great efficiency and long life.

The "PLANET JR." line comprises in addition, Wheel Hoes, Horse Hoes, Pivot Wheel Cultivators, Orchard Cultivators, Celery Hillers, Markers, Levelers, Potato Diggers, Sugar Beet Seeders and Cultivators, etc. Each implement is equipped with a variety of attachments, making them suited to a number of uses.

The new 1900 "PLANET JR." catalogue, 350,000 of which are now ready for distribution, is in point of beauty, original illustrations and general utility the superior of any similar work ever published. It covers every variety of special and general gardening and farming, both in illustration and text. It's full of points of profit. We mail it free on application.

S. L. ALLEN & CO., Box 1107-D, PHILADELPHIA, PA.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

FAILURE TO COME IN HEAT.

I have a grade Jersey cow, four years old; has had two calves and has been milking, now, about 15 months. Does not show any sign of being in heat except when near other animals. Have taken her to be served six or eight times, but she always refused the animal. Once tied her to tree and was served, but it did no good. C. L. S.
Minneapolis, Minn.

ANSWER.

You need a sure and safe emmenogogue medicine to cause menstruation--heat. I can't advise you better than the medicine advertised in the DAIRYMAN.

PARALYSIS.

I have a number of last spring's pigs which have lately broke down, and began to drag their hind parts around. It seems impossible for them to walk at all. Some more of the same drove have blubbers or rupture under their belly, which began shortly after weaning, and at the present time the blubber is as large as a quart dipper. These hogs, from the time of weaning until now, have been getting all the corn they could eat, and milk from separator to drink. E. M. G.
Tripoli, Ia.

ANSWER.

Paralysis of the posterior extremities is a mysterious and quite dangerous disease, as in porcine anthrax, i. e. hog cholera, etc., etc. The opinions as to the causes are multifarious, and quite at variance with each other. Treatment is simple, but unreliable. Rub well all over the loins and back with common turpentine. Rub hard and long. If this does not succeed, rub with the following liniment: Oil of cedar, 4 ounces; strong camphorated spirits, 4 ounces; turpentine, one ounce; sulphuric ether, 2 ounces; fish oil, 20 ounces. Well shaken and out of the sun light, and well corked. Don't know what you mean by blubbers.

PERHAPS LUMP JAW.—LUMP IN TEAT.

Have a calf with swelling on lower jaw. What are the symptoms and remedy for lump jaw? If some swelling not so fatal as lump jaw, what shall I do with it?

Have a cow with a lump in her teat, we can milk it all right, yet there is some danger. D. J.
Thornhill, Ont.

ANSWER.

It may or may not be actinomycosis—lumpy jaw—but it is quite suspicious of it.

Cut off the hair close and paint over several times a day with strong tincture of iodine. This is for a common tumefaction, not for the disease above alluded to.

(As long as the milk can be drawn in the ordinary way, "it is better to bear the ills we have, than fly to others that we know not of."—OFFICE EDITOR.)

TICKS IN THE COWS EARS.

How can I get rid of ticks in the ears of my cows and calves. If we don't keep on the lookout they will literally stop up the ears of the stock. I go through the herd regularly once a week and clean out the ears with a blunt scraper and then anoint with lard, but in a few days they are back again as bad as ever. They don't seem to infest other parts of the body.

The variety appears to be the ordinary cow tick, which I have seen often on the back parts and between legs of cows, in the States.
Saltillo, Mexico. J. R. S.

ANSWER.

First carefully pick out all of the ticks, don't leave one in the ears. Use the following, and push back not too far, into the ears: Oil of tar two drams, only, fish oil, six ounces, kerosene, 2 ounces; to be well mixed at each time of using. I use for all such vermin, flies included, Shoo Fly, manufactured in Philadelphia. It is safe and effective, if used daily. I have used it five years and can conscientiously recommend it.

LUMPY MILK.

I have a cow that freshened about Oct. 1st. she seemed to be all right until about six weeks ago, when she commenced giving lumpy or clotted milk, from the left hind quarter. I gave her two or three doses of salts and bathed the quarter with camphor and spirits of turpentine which stopped the clotted milk in that quarter and also diminished the flow of milk. The right hind quarter seems to be affected the same way. M. H. V.
Vail's Mills, N. Y.

ANSWER.

Immediate full dose of physic, and repeat and *repeat*—it not well in five days, use the same liniment. Camphor always has a tendency to stop the secretion of milk. But, the flow will return after the disease is over, no doubt.

LUMP IN UDDER.—DEHORNING.

Have a cow which has a lump in right hind quarter of udder, it came there about 20 months ago but did not affect her much until about three weeks ago. This lump before this was about the size of a tea cup, and hard and in the top of the quarter at the back. Then about three weeks ago the whole quarter filled with a cake and excreted thick milk when milked, the original lump remaining the same as before. I gave her a drench of one pound Epsom salts, followed in seven days by another of the same amount. After the first drench I gave her daily sixty grains potassium iodide for twenty days. After about fifteen days' treatment the second gathering disappeared and the milk became natural again, but the original lump is there still. Is the milk now fit for use for making butter?

Have had my herd dehorned while I was giving her the iodide powders. And I noticed she was the only one that had matter running out of her horn. P. P. F.
Amprios, Ont.

ANSWER.

Nothing you can do is as good as the physicking; this is systematic. Generally, local remedies are of little value when such conditions exist, when compared with general internal medicine. Continue the iodide of potassa as may seem to be needed. Upon the original lump use strong tincture of iodine; put on with a camel's hair brush and be careful not to touch any portion of the udder but the tumor. Yes, the milk is fairly good. Aren't you asking a great deal, after 20 months' neglect, to expect a cure in one month?

It is due to the dehorning. If still sore and running, dress with compound myrrh and aloes, liberally, twice a day. If you do not keep the wound clean you are quite likely to have a serious and dangerous abscess form upon the head.

BUNCH ON KNEE.

I have a choice bred calf, Holstein bull, 10 months old, has had a bunch on his knee, since about 2 months old, about as large as a man's fist, soft. He is a little stiff in that knee. A. L. P.
Little York, N. Y.

ANSWER.

Above all things never open the sack; cut off the hair close and apply Gombault's Caustic Balsam two or three times a day until a strong scab is formed. Then stop using the balsam for awhile, cover with hog's lard daily until the scabs are off. Then you are to repeat balsam again as before, and so continue till you are satisfied you have done enough. Then report to me, if needed.

ECZEMA.

Heifer with first calf has scaly white scabs on neck and different parts of body; is said to have been in this condition over a year. Udder and legs chafe badly, appetite good, eyes bright, but has low vitality and has nearly dried up in two weeks, with calf; although have nursed her carefully. L. D.
Gunston, Va.

ANSWER.

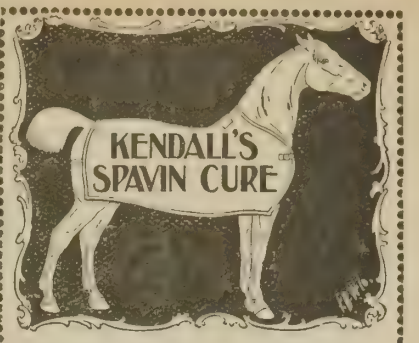
I believe you have a bad case of neglected eczema—over a year. Pyroligenous acid, 16 ounces; oil of tar, 1 ounce; fish oil, 20 ounces. Rub this in with the finger to each individual pimple or scab, daily. Internally give the richest and most nutritious food and give 4 drams of blue flag and three ounces of old whisky, to which add 3 drams of burdock; one dose each day for 4 days; then wait 5 days; then repeat to 3 doses; then one dose every third day for 30 days, only. Pare your finger nails.

LACK OF POTENCY.

Last spring I secured a full blooded Jersey bull calf to head my cows, and although the calf is now about a year old, he is apparently no use for service as he has served four different cows and some of them as often as three times, but nevertheless all come in heat again in due time. H. F.
Silvana, Wash.

ANSWER.

Bulls, like all male mammals, are subject to many peculiar conditions. All males seem to be governed by physiological heredity. Some develop too soon, and soon pass out of the productive usefulness; some develop slowly, and last much longer in usefulness Let the bull be kept away from all service. You don't give the previous history of the calf. He, no doubt, was evidently raised, and allowed to serve before he was able to, without losing his vitality. Rest will save him, I think. If not, apply to me again.



LUMP IN TEAT.

Bought a registered Jersey cow of a breeder some six or eight weeks ago, represented to be all right in every way. I found two quarters contained hard cores, the size of my fist, and gave very little milk. I have been unable to get rid of this core. Have fomented it with hot water, given physic once or twice and "Kow Kure" G. L.
Adams, Wis.

ANSWER.

In all my professional experience up to the present time I have never found anything so potent and as good, in any sense, as systematic and intelligent physicking and rubbing with the camphorated spirits and turpentine mixture, six of one, and two of turpentine. Massage is a great help in all such cases. It is to be followed up by regular and persistent practice.

My firm belief is, that you got a poor bargain, in the shape of a chronically spoiled udder. Never give anything not known to be fit for the disease. You may give seventy grains of iodide of potassa in a little cold water, as a small drench each morning for 20 to 50 days, as may seem to be needed.

WORTH $50 A BOTTLE To This Man.

It may be worth a like sum or even more to you.
Fingal, Barnes Co., N. D., March 19, 1898.
Dear Sirs:—I have used your Kendall's Spavin Cure and I think it a good Liniment. I have cured a Spavin on my best mare, and I would not take $125 for her, which I offered for $75 before. I will be pleased to have your book and receipts for this inclosed stamp, as I read on the cartoon.
Truly yours, FRANK SMITH.

It is an absolutely reliable remedy for Spavins, Splints, Curbs, Ringbones, etc. Removes the bunch and leaves no scar. Price, $1; six for $5. As a liniment for family use it has no equal. Ask your druggist for KENDALL'S SPAVIN CURE, also "A Treatise on the Horse," the book free, or address
DR. B. J. KENDALL CO., ENOSBURG FALLS, VT.

ROBERTS' ANTI-ABORTION SERUM

Hypodermatically administered, is a POSITIVE CURE for abortion in cows. Sworn testimonials furnished on application. Address

Dr. Horne's Anti-Abortient

Prevents Abortion and cures Nymphomania—failure to breed; also Emmenagogue Powders for cows failing to come in heat. Both powders are the result of long practical experience and study and may be given in a little moist feed. 5 oz. $1, 11 oz. $2, 23 oz. $4, 50 oz. $8, by mail.
Also Specific for
SOUTHERN CLIMATIC FEVER
Same price and same quantity as above.
SAFETY HARD RUBBER MILK TUBES with hole in the end, and DILATING PLUGS

(Patent applied for.)

My Hard Rubber Tubes and Hard Rubber Dilating Plugs supplant all kinds of metal tubes. No blood poisoning or bruising. No dropping out of teat by its own weight. Two hard rubber tubes, 2 and 3 inches long, and two plugs $1.50 the four—and also one bistuary and two plugs $1.50 the three. By mail, the whole set $3.00. In writing for medicine, please say if the cow does or does not come in heat—as the medicines are as different as fire and water.
DR. WM. HORNE, Janesville, Wis.

Myself cured, I will gladly inform anyone addicted to COCAINE, MORPHINE OPIUM or LAUDANUM, of a never-failing, harmless Home Cure. Mrs. M. F. BALDWIN, P. O. Box, 1212, Chicago, Ill.

GREAT GRASS.

Successful dairy farming makes heavy drafts on the best information that can be obtained in the production of all kinds of forage crops. To be a successful grass and hay farmer is a great thing, so great indeed that we have a hundred to one more men who are successful grain growers, than in grass and hay production.

A friend sends a clipping from an eastern paper, without stating its name, in which is the report of Mr. George M. Clark, of Connecticut, for the year, on his method of producing a heavy grass crop. Mr. Clark says:

My crop this year covers 7½ acres, originally seeded to equal parts of redtop and timothy, 16 quarts of each kind of seed to each acre. A part of it has been seeded ten years, and a part of it three years. All of it has a fair stand, particularly that part of the field that has been seeded ten years; this section of the field contains seven-eighths acre, and has yielded over 80 tons of well-dried hay in ten years. I did not expect much of a crop this year, for the reason that I had little time to devote to it, yet I have cut the largest average crop this year that I have ever had. I used 4,500 lbs. of Rogers & Hubbard's oat dresser, and spread over the field, 600 pounds to the acre, and when it was time to cut and put in the barn the hay was very thoroughly dried, and weighed 75,755 pounds, nearly 38 tons. The cost for each ton of hay in the barn was, for fertilizer, $3; spreading same, 15 cents; cutting and securing crop in barn, $1.20; total cost, $4.85. The hay is now worth $16 per ton in the barn, a clear net profit of $11 for the first crop. The second crop, without additional fertilizer, yielded a little over 7½ tons, and cost $2 per ton to cut and put in barn; a profit of $14. A net profit on the first crop of $416; second crop, $105. A total net profit of $521; over $500 from 7½ acres in the year 1899.

Considering the drouth which prevailed in Connecticut the past season, we consider the above showing a remarkable one.

Carbolic Acid for Abortion.

A Nebraska correspondent writes: "I have a herd of fifty cows and two of them have aborted. Is it prudent to allow these to range with the balance of the herd? If not, how long should they be separated?"

That depends altogether on the character of the abortion. As but two have aborted in fifty, it is probable that is due to slips, strains, hooks, or some other accident. In cases of this kind the loss is limited to the individual and is at most the loss of one calf. Under such circumstances it would not be necessary to separate them from the herd, as abortion arising from accidental causes is not contagious. As a matter of precaution, however, it would be well to separate them until they are completely restored to health and there is no evidence of vaginal disturbances. If, however, additional cases occur for which there is no known cause, then our correspondent should do something more than separate those that have aborted. He should separate all those that show signs of abortion and should begin a course of thorough, systematic treatment, disinfecting the stalls and stables, disinfecting the aborted animals, and giving the entire herd a course of treatment. The treatment we advise is carbolic acid, commencing with a quarter of an ounce to each cow twice a week. It should be dissolved in a large amount of water and thoroughly mixed with feed so that each cow will get her share and no more. We would increase this, in case abortion became frequent, to a half an ounce twice a week. Unless cows are particularly valuable as milkers, if we did not care to go to the trouble and expense or treatment of this kind, we would fatten them and sell them for beef. Unless the most heroic measures are taken and persisted in, epidemic abortion generally ruins a herd for either dairy or calf growing purposes. It is one of the most difficult diseases to deal with and the carbolic acid cure is the only one that we have ever known to be effective, and this only in the hands of men who would make it their business to follow up the treatment for months in all its details.—*Wallace's Farmer*

Transfers of Guernsey Cattle from Dec. 15 to 30, 1899.

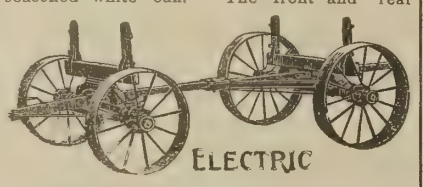
ILLUSTRATION.

An illustration of the value of careful feeding, especially for cows, is found in the following letter from Mr. Fred Surridge, manager of the Woodland Farm Dairy Co., at St. Louis, Mo. Writing to the Rippley Hardware Co., Grafton, Ill., Mr. Surridge says:

"Gentlemen,—The Cooker bought of you some time since is giving perfect satisfaction. My cows are giving 50% more milk while being fed on cooked feed than on raw. I will never regret the purchase. Yours truly,



Fred Surridge,
Manager Woodland Farm Dairy Co."

Other users of the Improved Reliable Feed Cooker are equally as enthusiastic in their praise. The fame of the cooker has spread abroad, and orders are now being filled for the English trade. This reputation has been won solely on merit; the Improved Reliable being the cheapest and the safest to operate, as well as the most durable feed cooker made. A special offer is being made to the readers of Hoard's Dairyman this month; we advise all dairyman to write to Rippley Hardware Co., Grafton, Ill., for terms and circulars.

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

hounds are made from the best angle steel, which is neater, stronger, and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers

Water in the Stable a Necessity.

It is now regarded as a necessity that stock in the stable should have constant access to water of suitable temperature. The dairyman who today turns out his cows to drink, is as far behind the age as the farmer who cuts his grass with a scythe, or rakes it up with a hand rake. Write for descriptive catalogue of the best known and best System of watering Devices for Cattle in Stables to

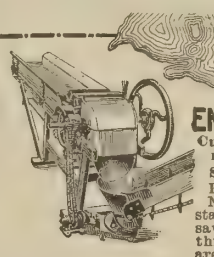
ELECTRIC FEED MILL



We have put out this mill to meet the demand of the patrons of the famous Electric Goods for a good mill at a fair price. It is a direct grinder and absorbs or wastes no power in useless and expensive gearings. Cuts, crushes and grinds ear corn, and all small grains single or mixed. Adjustable—grinds coarse or fine. Prices low. Circulars and prices free. ELECTRIC WHEEL CO., Box 180, Quincy, Ill.

A Handy, Hand Cutter.

This No. 239 Wolverine Jr. Feed Cutter is a light, strong, easy turning, fast hand cutter for cutting all kinds of feed. Has extra wide throat—makes machine easy to feed and easy to turn, as a very wide but thin layer of feed can be passed to the knife. Will stand heaviest work. Knife is 11¼ in. long. Heavy balance wheel 25 in. diameter makes machine run steady and easy. Cuts ¼, 1, 1½ and 2 inches. Instantly changed from one cut to another. Weighs 170 lbs. An ideal cutter for the small farmer or stock owner. Like all goods we sell, this machine is guaranteed in every way or money refunded after trial. Send for free 336-page illustrated catalogue. We have 53 sizes hand and power cutters and shredders.
$7.85
Marvin Smith Co., 55-57-59 N. Jefferson St., N-18, Chicago.

"OHIO" SELF FEED ENSILAGE CUTTER

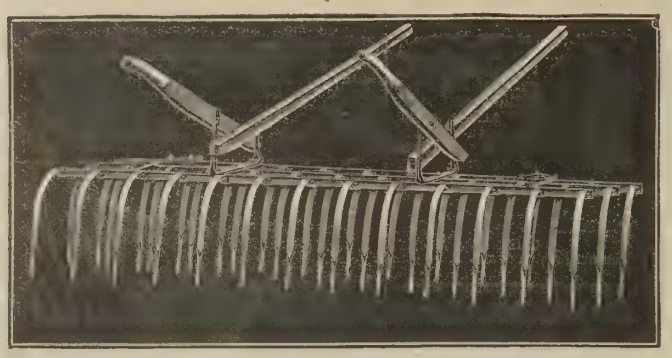
Cuts 33⅓ % more than regular machine.
Saves 75% in time.
Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids re-cutting, binding, choking, &c. The cut shows
NEW METAL STRIP SWIVEL CARRIER.
Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue FREE. Prof. Woll's "A Book on Silage" 10c.
THE SILVER M'F'G CO., Salem, Ohio.

"Appleton goods take the lead, and your steel link tread, all told, has no rival."—MANLEY BROS. & STONE, Harvard, Ill.

Hundreds of Similar Testimonials prove that our
"SUCCESS" TREAD POWERS
are properly named. We make 1, 2 and 3 horse tread powers, smooth or level lags as desired, down or mounted. The

ONE-HORSE "SUCCESS"
is the best power made for driving cream separators, and all machinery requiring light power, but absolutely steady motion. More power can be obtained from the "SUCCESS" Tread Powers size for size than any others because they run light, are roomy and strong enough for largest horses, best governed, etc. More about them and our sweep powers, shellers, fodder and ensilage cutters or shredders, huskers, grinders, wood saws, wind mills, steel tanks, etc., in our 160 page illustrated catalogue. FREE.
APPLETON MFG. CO., 35 Fargo St., BATAVIA, ILL.

SHREDDED CORN FODDER
Saves The Whole Crop.
This is the Original Shredding Machine.



Knowing that you are convinced of the great food value of shredded corn fodder and the great saving that shredding produces we shall only tell you of how best to prepare it.
ST. ALBANS FODDER SHREDDERS
are especially designed for this purpose.
They are a pronounced success. They shred faster, finer and leave the product in better condition for feeding or baling than any other machine made. We prove these statements by those experienced in the usage of such machines. We mail Facts About Shredders FREE. Write for it at once.
St. Albans Foundry Co. St. Albans, Vt.

Hallock's Success Anti-Clog Weeder

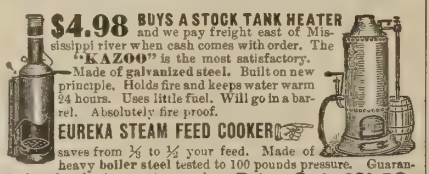
More than 40,000 of our Weeders now in use. Does this mean anything? We expect our sales in the year 1900 alone to crowd these figures. Why? Listen, please:—Material used in manufacture of implements has advanced fully 100 per cent. Your dealer will ask you largely advanced prices for all implements. If you doubt this, call on him.

TAKE NOTICE---Hallock's Success Weeder will be sold at the same old prices—not one cent advance.

More than 7,000,000 farmers in the United States, every one of which will own a Weeder in the next few years. Practically every one of them would buy in the year 1900 if they knew as much about the value of our Weeder as the 40,000 who now own one. We have decided that we may just as well have practically all of the "Weeder trade." To secure it, we have decided on prices that are bound to bring it. Just write and see if you do not think so.

We Sound a Note of Warning

Under U. S. patent No. 600,782, issued on March 15, 1898, we have the exclusive right to make a Weeder having teeth substantially round at lower end and a flat spring-yielding upper portion. This style of tooth gives our Weeder great superiority over all round tooth weeders and has caused it to become immensely popular. Farmers demanded of their dealers a weeder having such teeth, and the dealer in turn demanded them of the manufacturer. This led different manufacturers to assume the risk of using a similar tooth. Therefore, we hereby notify manufacturers, dealers and farmers that we have already brought suit against several and will promptly and vigorously prosecute all similar offenders.



Let us repeat:—It is an absolute fact that the price of all implements has advanced from 25 per cent to 50 per cent., but Hallock's celebrated Success Weeder will be sold at the old prices. Trade always follows where our Weeder is introduced, therefore, to get this trade, we will quote **Special Price** to first purchaser. Remember, we are the Weeder people and we have the price that sells.

D. Y. HALLOCK & SONS, Box 812, York, Pa.

WANT A CUTTER? Let us send you description and picture of our **Swell Body Cutter, No. 411.** Built of selected stock, first class workmanship throughout, and finely upholstered in raw silk, for **ONLY $13.90.** Other styles at equally low prices.

EVERYTHING FOR THE FARMER. We can save you money on Corn Shellers, Feed Cutters, Sweep Mills, Horse Powers, etc. Vehicles, Harness and Agricultural Implements. Don't miss our **big new catalogue.** It is full of money-saving bargains. Sent **free.**

$4.98 BUYS A STOCK TANK HEATER and we pay freight east of Mississippi river when cash comes with order. The **"KAZOO"** is the most satisfactory. Made of **galvanized steel.** Built on new principle. Holds fire and keeps water warm 24 hours. Uses little fuel. Will go in a barrel. Absolutely fire proof.

EUREKA STEAM FEED COOKER saves from ⅓ to ½ your feed. Made of **heavy boiler steel** tested to 100 pounds pressure. Guaranteed to be the best cooker made. **Price Only $21.50.**

THE RURAL NEW-YORKER

SUBSCRIBERS are going to receive the prettiest and most valuable novelty ever distributed by the paper. It is the beautiful new climing rose, "RUBY QUEEN," originated by its editor on its own experiment grounds. Roses of similar merit usually sell for 75 cents to $1, when first introduced, but the Rural Experiment Grounds are conducted for the benefit of the readers of the paper, and novelties originated there are distributed free to yearly subscribers. Prizes of $10 for the best, $5 for the second and $3 for the third best cut flower of this rose will be awarded the second year, when it will bloom profusely. The subscription price of THE RURAL NEW-YORKER is $1.00 per year.

We will send it, including this Beautiful New Rose and HOARD'S DAIRYMAN both one year for $1.65

SEND AT ONCE before the supply of roses is exhausted. THE RURAL NEW-YORKER is by all odds the best farm and fruit paper published in any country in the world.

THE BOER WAR

is exciting acute interest in all parts of the world, but the subject of vital interest to agriculturists in all parts of the United States is

How to Make More Money on the Farm.

The surest way to do it is by following in the footsteps of those who are the most successful, and a path is blazed straight and clear through the colomns of

THE PRACTICAL FARMER, of Philadelphia.

America's Leading Agricultural Weekly. $1.00 PER YEAR.

It is the only purely agricultural weekly published whose contents are directly applicable in an intensly practical manner to the every day work on the farm. Its editors comprise the leading agricultural writers of the country, and its **Unique Special Departments**—Experience Pool, Short Cuts, Mistakes, Failures and Successes, Farm Implement Annex and Postal Card Correspondence (all of which are supported by contributions from its readers, and for which contributions CASH PRIZES are paid every week), keep it in close personal touch with subscribers every week in the year.

The Practical Farmer's Library, issued quarterly, is one of the most valuable additions to agricultural literature ever published. You can learn full particulars of it in the columns of The Practical Farmer. **The Supply Department** of the Farmer Co., is prepared to quote you an inside price on anything you wish to buy, from a needle to an anchor.

No. 12 Farmers' Supply Catalogue contains 208 pages, illustrated and quoting wholesale prices on hundreds of articles of every day want. It also contains **a complete Calendar for 1900.** Send a postal card to The Farmer Co., 18th & Market Sts., Philadelphia, mentioning HOARD'S DAIRYMAN, and they will send you sample copies of The Practical Farmer, also a copy of No. 12 Supply Catalogue. **WRITE TO-DAY.**

SPECIAL OFFER.—By special arrangement with The Farmer Co., we are enabled to offer The Practical Farmer and HOARD'S DAIRYMAN both one year for **only $1.50.** Address all orders to **HOARD'S DAIRYMAN, Fort Atkinson, Wis.**

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

HOARD'S DAIRYMAN.

BE HONEST WITH YOURSELF.

If the old plan did not pay you last year, why deceive yourself with the hope that it will pay you this year? If the conditions are against the old plan, why not conform with the requirements of the conditions and adopt a plan that does pay. Do you want us to tell you of a new and better plan? We need only to refer you to this little picture of the

THE
MOODY-SHARPLES SYSTEM
For the Creameryman and the Dairy Farmer

Compliments of....

P. M. Sharples

The Sharples Co., Canal and Washington Sts., CHICAGO, ILL.
West Chester, PENNA., U. S. A.

Moody-Sharples Creamery

Located at NASHUA, IA.

NOT WONDERFUL IN SIZE, BUT WONDERFUL IN RESULTS.

Every patron of this creamery owns a **Sharples Dairy Separator** and separates his supply of milk right at home. **The System is right** and when fully adopted insures larger profits for both the creameryman and the farmer than is possible under any other plan. Write us for full particulars as to how the Moody-Sharples Creamery is operated; how an energetic butter maker can secure a factory of this kind, and how an ordinary separator factory can adopt this plan without expense to the owner.

WHEN YOU BUILD A FACTORY

or when you are needing new machinery for a factory already built, do not forget that we are prepared to furnish you with the best machinery and appliances on the market. Our goods are sold strictly upon their merits and **ARE NOT CONTROLLED BY THE TRUST.** We can give you satisfactory prices and prompt service upon complete outfits or any part of an outfit. Here are a few of our specialties:

Sharples TUBULAR Separators, Sharples Dairy Separators, Sharples Natural Wood Vats, Sharples Russian Babcock Testers, Sharples "All-Over" Butter Printers, The "Squeezer" Combined Churn and Butter Worker, The Improved Haney Cream Carrier, The Price Economical Milk Heater.

Our old customers know that the goods sold by us have that distinguishing feature commonly called **Sharples Quality** which is not found in goods sold by the **Trust.** We furnish the best and charge no more than others ask for inferior goods. Write for prices.

THE SHARPLES CO.,
28, 30 and 32 So. Canal St., Chicago, Illinois.
Factories at West Chester, Pa., and Dubuque, Iowa.

THE TUBULAR IS NEW.

Just a little over two years old, and so is the best of everything new. As improvement is the order of the age, the best things are necessarily new: For instance, the latest Telephone and Phonograph, the latest Bicycle, the latest Automobile, etc., etc.

Not so many of the Tubulars are in use as of some other machines; there are always more of the old than the new; more of the old tin pans than of separators.

But owing to the great merits of the Tubular Separators more than three times as many of them are in use as was the case with any other separator at the same period of its existance.

The very first Sharples Tubular that was sold a little over two years ago is running to-day handling over four thousand pounds of milk per hour and leaving not over .02 of fat in the skim milk, and has not cost $1.00 so far for repairs.

Great improvements have been made in the Tubular machines since the first one was sold, but these only add increased value for the present buyers.

The Sharples Tubular Separator

represents the latest great stride in advanced cream separator construction.

More Revolutions but Less Speed. More Centrifugal Force—Less Power. More Perfect Cream—Less Fat Lost. More Durability and Less Complication.

Send for Catalogue No. 46.

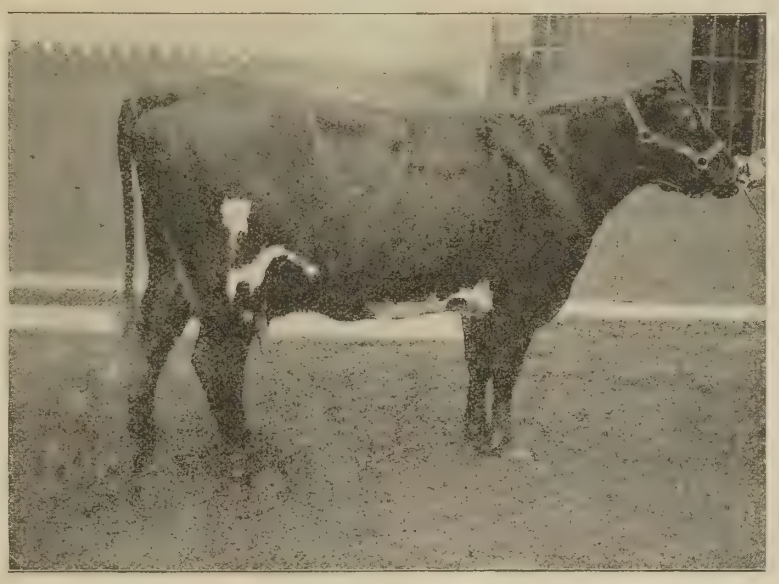
A Luminous Report on the Breeding and Selection of the Grade Short-horn Cows at the Wisconsin Experiment Station.

ED. HOARD'S DAIRYMAN:—Whenever unusual excellence is attained in the breeding and raising of any of our domestic animals, it is natural that those who are interested in that kind of stock should be anxious to know by what process of breeding and handling this superior excellence has been attained; for the best animals are not often the result of accident, but are the result of long, patient and intelligent work with a definite object in view.

After reading in the Wisconsin Experiment Station Report for 1899, the fine record made in milk and butter production by some high grade Short-horn cows, the editor of HOARD'S DAIRYMAN, with the expressed purpose of learning all the facts possible concerning these cows, requested me to go to the vicinity of Oregon, Wisconsin, where these cows were purchased, and make inquiry of the former owners in relation to their ancestors, and other animals of the same family, and also to see and note the appearance of as many as possible of the animals of these families. I had seen the cows at the Station two or three times.

In compliance with this request, I visited the village of Oregon, which is on the Chicago & North-Western railroad, ten miles south of Madison, and is a thriving and pleasant town of 1,000 inhabitants, located in one of the finest farming districts of Wisconsin. A lively ride of two and a half miles to the north in a cutter, brought me to the fine farm of Robt. Keenan, of whom was purchased the cows Rose and Maud. It will be seen by the report, that Rose produced 506 pounds of butter, and Maud 376 pounds last year. Maud's butter, cost in food, 8.3 cents a pound, and Rose's cost 6.9 cents a pound.



I found Mr. Keenan a pleasant and agreeable gentleman, and willing to give me all the information in his power, concerning the object of my visit.

What Mr. Keenan said I give nearly in his own words, and it was corroborated, for the most part, by his wife, who, by the way, appears to be equally interested and well informed as her husband in the matter of raising stock.

Mr. Keenan said: Rose and Maud are descended from a long line of female ancestors, which were all large milkers, and most of them noted for their large size and bony appearance. I remember them back for thirty years or more. They have come down through the successive ownership of my grandfather McKee, my father and myself. The grandmother of Maud and the great grandmother of Rose was the first cow of that line, that came into my possession. She was a great milker, and we called her "Old Bones." "Old Bones" grandmother was a native, or a cow of no particular breeding, for up to this time no pure blood of any kind had been introduced into my father's herd. The only aim of my grandfather and my father had been to keep up and improve the milking qualities of their cows. They were very particular in the selection of a sire, to every time get one whose female ancestors were the best of milkers.

The grandmother of "Old Bones" was bred to a Short-horn of the milking type. The same was done with her mother, so that "Old Bones" was a three-fourths Short-horn. She was always poor, that is why we gave her that name, her feed all went to milk. We kept her till she was old, and sold her with but little meat on her, and did not get much for her. "Old Bones" was bred to a full-blood Short-horn bought of Wm. Kiser. This bull's mother was such a heavy milker, that when he was a calf and running with her, he, though a lusty fellow, could take only a small part of her milk. The consequence was, her udder became congested and broke, and then she lost it entirely. Then the calf had to be sold, and that is the way I came to get him. "Old Bones'" calf from this bull was Bob. She was fully as good a milker; used to give sixty pounds a day, and was very persistent. We kept her till she she was sixteen years old, and sold her for one cent a pound. She had stopped breeding, not having had a calf for two years. I sold her poor; could not fatten her, as she was old, and had lost her teeth, but she kept right on giving milk till I sold her.

Next was Rose's mother sired by a Short-horn, I bought of Joseph Kiser. He was bought at a sale, and bought cheap, because he looked inferior they said, but he was of good milking stock. Rose's mother was a good milker, but she was sold before she came to maturity. Rose was sired by a Short-horn of dairy type.

GRADE SHORT-HORN COW, ROSE.

Property of WISCONSIN EXPERIMENT STATION.

Yield of milk, 10,163 lbs.; butter, 506.12 lbs., for the year 1898.

GRADE JERSEY COW, GOODRICH.

Property of WISCONSIN EPPERIMENT STATION.

Yield of milk, 6,967.1 lbs.; butter. 398.08 lbs., for year 1898.

ROSE LOOKS LIKE "OLD BONES."

After taking this statement of Mr. Keenan's we went out to take a look at his herd which is not large. He showed me 5 heifers and cows which are descendants of "Old Bones," also some steers and calves of the same family. None of these cows could be called "bones" without slandering them, for their frames were covered with a good coat of flesh. They were all nearly dry, being due to calve in the last part of winter. Mr. Keenan keeps no ill fed animals of any kind. Like the rest of us he has no clover hay this year and his cows are fed mostly on heavily eared shock corn, and fed very liberally. This accounts for their being quite fleshy and not holding out as well as usual in giving milk.

But in spite of this the evidence of superior dairy ability shines out plainly. Their fine heads with broad foreheads, bright and prominent eyes, showing great intelligence and nervous power; their finely formed necks, well cut up under the throat; their strong and prominent backs and depth of bodies, all point to the power to give milk generously when given proper food. But I very much doubt that any of them will ever equal Rose.

There were some steers that were being fed, three of them of the Rose family. These are fairly good steers, though I think no beef man could say they are really first-class. Mr. Keenan has weighed them and says they run from 800 to 1,000 pounds each at from 15 to 19 months of age.

After this Mr. Keenan had the kindness to hitch up and drive me to the farm of Mr. Garrett Barry, 1½ miles west, of whom the cow Belle was bought, which produced at the Station, 392.96 pounds of butter last year at a food cost of 10.3 cents a pound. Mr. Barry has quite a large herd of grade Short-horns. They are most of them of large size and judging from the appearance of the cattle I should say Mr. Barry has not made as successful an effort to breed in dairy lines as Mr. Keenan has. Mr. Barry has none that are related to Belle but her two-year-old daughter. And she was the only one I noticed that bordered on the dairy type. With this single exception I feel certain none of the cows he had there in the yard can ever equal Belle in dairy products. Of the breeding of Belle, Mr. Barry could only say that she was from a grade cow that was a good milker, and sired by a thoroughbred Short-horn bull.

This ended my investigations among these farmers, but on my return to Madison I could not resist the temptation to go to the Station barn and once more look over the cows. Of Rose I have this to say, she is of a very excellent dairy type. From a dairyman's standpoint it is hard to find any fault with her form and general make up. Her head and neck are simply perfect and their like are seldom seen. The broad face which looks somewhat dishing because of the prominence of her splendid eyes, denotes a wonderful nerve power. She has a fine clean-cut neck, high withers, high back bone, high pelvic arch, long body, open ribs, relaxed appearance, deep middle and incurving thighs. Some say her udder is not good shape, but there is enough of it to transact all the business that her powerful dairy machinery is able to give to it.

Maud has a very good dairy form but not as good as Rose has. Her head with her rather dull sluggish eyes is her worst feature to the eye of the man who is looking for that nerve power which all great producers must have.

Belle is a big, coarse, rough cow considerably of the dairy type, and surely not of a good beef type. C. P. GOODRICH.

A Silo Justifies Itself.

Vermont Skeptics Silent.

ED. HOARD'S DAIRYMAN:—I wish to say a word in regard to the silo, to those who have not yet built, in particular. From a description taken from the DAIRYMAN the past year, I built me a round silo, (the only one in this vicinity) under a great deal of protest and advice from my neighbors and friends, to the effect that it would all rot and that it would not hold anything, and numerous other objections.

Nevertheless it was built round, and filled. The cost of building was not over one-half of what it would cost to build a square one, and to say that I am pleased with it, and the ensilage that I am feeding, does not half express it. There is not a mouldy spot in the whole of it, and it is pronounced by the skeptics who condemned the round silo, before it was built, to be the finest ensilage they ever saw. It is built of 2×6 hemlock plank, 12 feet long, sized, edges square, and five-eights iron hoops 3 and 4 feet apart.

ANOTHER OPPORTUNITY FOR THE EXERCISE OF JUDGMENT.

The illustrations this week are of two cows at the Wisconsin Agricultural Experiment Station. One of them is the cow Rose, concerning which Mr. Goodrich writes so fully and so candidly in another column. This cow was selected by Prof. Carlyle, and was the first cow purchased for the new dairy herd. The other is the cow, Goodrich, and was selected by Mr. C. P. Goodrich for the new herd, as a good type from his standpoint of the special-purpose dairy cow.

The cuts from which these illustrations are printed, were loaned to us from the Station, and were made from photographs of the cows without any retouching or other amendment. They may be considered, therefore, as faithful representations of these two cows, the one a large grade Short-horn, and the other, a small grade Jersey. The former is a mature cow. The latter was only three years old when taken into the herd, and has made some considerable increase in weight in her new quarters.

The question we submit for each one of our readers to answer for himself is: In what material respect do these two cows differ in conformation?

The record of the cow Rose was made in 326 days, and shows 10,163 lbs. of milk, containing 438.82 lbs. of butter fat. Adding one-sixth to this fat gives an estimated yield of 506.12 lbs. of butter at a cost of 6.9 cents per pound for feed.

The cow Goodrich was milked 330 days, and her record was 6,967.1 lbs. of milk, containing 341.22 lbs. of fat, equivalent to 398.8 lbs. of butter, the food cost of which was 7.9 cents per pound. These figures show that for this milking period at least, the cow Rose was the better and the more profitable cow. It was not deemed prudent to feed the cow Goodrich to her maximum capacity, but in the language of Prof. Carlyle: "We are sparing her now, hoping for much better records in the future."

We are of the opinion that after attentively studying these illustrations and these records, our readers will agree with Prof. Beach of Connecticut, that so far as performance at the pail is concerned, type is of more importance than breed. This has always been the contention of HOARD'S DAIRYMAN. There is, however, another very important point for the dairyman to consider. He wants a cow that not only will produce profitably at the pail, but will be able to reproduce herself in her offspring. When she can do this she may be denominated a dairy cow—in fact, a special-purpose dairy cow, no matter from what breed she sprang. On the contrary, there are in the aggregate, large numbers of cows that perform profitably at the pail, but do not have the inherited prepotency necessary to insure a similar performance by their offspring. Such cows cannot properly be denominated special-purpose dairy cows.

The breeding of the cow Rose, as described by Mr. Goodrich, shows that for many generations past, her dams in particular, have shown anything rather than the beefy conformation. The name of her maternal ancestor is very significant on this point. It is also significant that she traces to a sire that was rejected by many bidders at a sale because he failed to show the fashionable Short-horn characteristics. As a consequence he was bought cheap, and the general judgment was that he was of inferior quality.

HOARD'S DAIRYMAN, neither in this instance nor any other, has a disposition to avoid or conceal any fact, and that this cow had four thoroughbred Short-horn sires in her pedigree demonstrates to us that her maternal blood lines were strongly prepotent.

Once again we say, compare the illustrations here given of these two cows. Note in what respects they agree in conformation, and in what respects they differ. They are cows of as widely diverse breeding as one can expect to find, but they are both wonderful and economical producers of milk and butter, and we think it fair to say that a man who will go out and buy cows corresponding in form to either of these will be pretty sure to secure a good bargain.

Sugar Beet Pulp.

Seth Conrad, Allegan County, Michigan, asks our opinion of sugar beet pulp as a feed for dairy cows, to be fed in connection with grain and other roughage.

The answer is that by analysis this pulp is found to have about one-half the feeding value of good corn silage. In the sugar beet growing portions of Nebraska it has been fed very extensively to fatten steers, and with great satisfaction. From different sources we hear of its use as a food for milch cows and with nothing to its disadvantage. It will be remembered, however, that fully 90 per cent of this pulp is water which leaves only 10 per cent of solid matter. It may therefore be fed very liberally, 40, 50 or even 60 lbs. per day would be, perhaps, none too much. Indeed, there are experiments reported from Germany, where at different times 44 lbs. were fed per day, then 66 lbs. and then 88 lbs. and the milk yield increasing steadily with the increase in the amount of beet pulp fed, or from 29.4 lbs. per day to 31.1 lbs.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	*Carbohydrates.*	*Ether extract*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

WHAT SIZE BABCOCK TEST.

The same inquirer asks what size Babcock test he needs in a dairy of thirteen cows. The very small two bottle tester answers a very good purpose, but of course with this, one can run off only two tests at a time, whereas it may quite frequently be, at least, convenient to use more. The extra cost of a four or six bottle tester will not be very much, and we are of the opinion that one of these had better be purchased.

SILO QUESTIONS.

I intend to build a shed this spring. In one corner I will have room for a silo, about eleven and one-half feet square in clear and about thirty feet high. Would a silo that size hold enough for about fifteen cows for about eight months? I could go in the ground four or five feet deep and wall it up with brick and cement, if you think that would do. Would you advise me to put up a round or square silo, and which one would be cheapest and best? Give me different plans for erecting the one you think would be best. I believe I would prefer a round one if it would hold enough for the amount of cattle I spoke of. Which is best, cut or shredded fodder? About how long should it be cut for best results?

Harmony, Pa. J. C. B.

A silo of the dimensions given above will hold about 80 tons. For feeding 15 cows 8 months you will require a little over 62 tons, so the above silo will be large enough.

If you are limited for room and can only build a silo 11.5×11.5, then a square silo of the above dimensions will hold more than a round silo 11.5 feet in diameter. The square silo will cost more to put up, both in time and material, than a round stave silo.

Cut the corn in inch lengths; shredded fodder has not been given sufficient trial yet.

We have given numerous detailed descriptions of the methods of building silos and at the present time have not room to spare to repeat them. You can obtain instructions by sending for bulletins on silo building, to the Pennsylvania and Cornell Experiment Stations, and if more details are wanted, would advise you to procure Woll's Book of the Silo, which will be sent from this office for $1.00 post paid.

A TEXAS RATION.

E. N. C., Paris, Texas, has a small herd of Jersey cows, and the following feeds are available: Corn in the shuck, 25 cents per bushel; bran, $16 per ton; oats, 27 cents per bushel; cotton seed meal, $18 per ton, and plenty of prairie hay. He has been having the corn and oats ground together. He asks for a feeding formula, and whether the feeds should be given wet or dry.

If he should feed 3 lbs. of oats, 3 lbs. of corn and cob meal, and 2 lbs. of cotton seed meal with 15 lbs. of hay, the digestible protein in his ration would amount to 1.73 lbs. This is not ordinarily considered sufficient to enable a first-class dairy cow to do her best, but the recent report of the Wisconsin Agricultural Experiment Station seems to indicate that less protein is required than we have been accustomed to think necessary, unless their feeds were of exceptionally good quality. A little Jersey cow, last winter, receiving only 1.75 lbs. of protein, yielded nearly 2 lbs. of butter per day. It has been the contention of HOARD'S DAIRYMAN for many years, that the Wolff standard, which calls for 2.50 lbs. of protein, was unnecessarily high, and we have been in the way these many years, of prescribing formulas containing from 2 lbs. to 2.25 lbs. of protein. When we get further details from this experiment of the station, we shall know more on this subject than we do at present. We think it will be well to try the combination above suggested, and if this does not work satisfactorily we would then substitute 6 lbs. of bran for oats and the corn and cob meal.

BLIND STAGGERS IN CALVES.

I would like to know whether cooked feed will hurt a calf's digestion in any way. We cooked ground corn cob and husk and fed to our calves last winter. They did well on it and they liked it, but when I turned them on pasture, three or four died with what we called indigestion. They acted like mad, would fight everything and in 3 or 4 days would die in great pain, trying to have a passage. W. V. H.

Cameron.

The cooking of the feed was not, in our opinion, the cause of the trouble; nor in this case is it likely to have been the cob meal, as suggested in the case of the Nebraska inquirer in another place in this issue. It is probable that the calves ate too much grass or found something of a poisonous nature in the pasture.

MILK, CALVES, BEEF AND HOGS.

A Nebraska inquirer who gives the above list of objects he has in keeping cows, asks us to give him formula for a ration. He says he never ties his cows up, but lets them run under a big shed and in the yard, where he has a long feed rack which is always full of oat straw, wheat straw, millet and cane hay. In addition to this, he draws in a large shock of corn fodder every day and besides gives his fifteen cows 100 lbs. of bran in the morning and the same amount in the afternoon, and about 200 lbs. of ear corn which is all they will eat. His cows are all dehorned, eat together like sheep and weigh from 1000 to 1400 lbs. each. Twenty shoats follow these cows, and get very little feed except what they find in the droppings. He veals his calves and keeps them fattenning from birth until sold, by giving them access at will to a mixture of oats, corn and cob meal, oil meal and shorts. Lately some of these calves have been taken sick with something analogous to blind staggers.

Although not a veterinarian, we think ourselves more competent to prescribe for the calves than for cows kept for so many different purposes as our friend specifies. We have no doubt that the trouble with the calves arises from indigestion, and we do not

wonder that indigestion follows such feeding as they receive. Perhaps the most potent cause for indigestion is the corn and cob meal. There would be no objection to the use of the pure ground corn, but we should hardly like to feed young calves the corn and cob meal. In the case of the cows the only suggestion that we feel warranted to make, is that probably the addition or rather the substitution of 1 to 2 lbs. of oil meal per day for double that amount of bran or corn would result in some benefit.

A NEW YORK RATION.

G. B. W., Ricard, N. Y., asks for a ration formula from timothy and clover hay mixed; oat straw; corn meal at $17; bran at $18; middlings, $18; ground oats, $18; oil meal, $30. His cows being fresh in milk, we suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17.06	.96	7.92	.32
6 lbs. oats	5.34	.55	2.84	.25
2 lbs. oil meal	1.82	.59	.65	.14
Totals	24.22	2 10	11.41	.71

Add straw *ad libitum*.

AN INDIANA RATION.

We regret that the crowded state of our columns does not permit us to publish in full, the very interesting letter from W. C. B., of Shelbyville, Indiana in which he asks us to formulate a ration for him, when he has plenty of good clover hay, wheat bran, $14 per ton; shorts the same. He also has corn and cob meal, and could get oil meal if so advised. For a ration formula we recommend as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16 96	1.36	7.16	.34
4 lbs. corn and cob meal	3.56	.26	2.52	.14
4 lbs. bran	3.52	.50	1.54	12
Totals	24.04	2.12	11.22	.60

A WISCONSIN RATION WITH SPLIT PEAS.

Fred Schumacher, Carlton, Wis. has been feeding his cows 20 lbs. timothy and clover hay, 8 lbs. of bran and 2 lbs. of cotton seed meal. He is running all the hay through the feed cutter as his cows seem to relish it better when put in that form. This is a good way to feed and we judge from the tone of Mr. S's letter that he has been having good success with his cows, but the cotton seed meal is all fed out, and it is difficult to obtain more, but he can buy split peas at 35 cents per bushel (60 lbs.); oats, 23 cents per bushel; bran, $15.50 per ton; and linseed oil meal, $25 per ton.

We think these split peas very cheap at the price quoted, and would be very glad to get a liberal supply of them for our own use. The formula we suggest for our friend is as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17 06	.96	7.92	.32
5 lbs. peas	4.48	.84	2.59	.04
5 lbs. oats	4.45	.46	2.37	.21
Totals	25.99	2 26	12.88	57

TEXAS FEVER.

I keep only one or two cows for family use but now desire to buy two or three well bred Jerseys; all or nearly all of the old stock that has been brought down here from the north die from what I understand is acclimation fever. I would like to ask you if we would run as much risk by buying yearlings, also if there is a successful remedy for the fever.

I am a new subscriber and not familar with the southern breeders below the fever line; Wm. M. V.

Ensley, Ala.

Young stock take the fever but in not so severe a form as older animals. The indications are that a remedy for this disease has at last been found, but at present it is in the hands of the experiment stations and is not in common use. The Louisiana Experiment Station has issued a bulletin on this subject, which can be obtained on application.

WISCONSIN QUERIES.

W. C., Waupaca, Wis., says he is feeding his cows now 4 lbs. corn meal, 4 lbs. bran with all the clover hay and cut corn fodder each cow will eat. If this ration is not all-right, he wishes us to give him a formula for improving it by adding oil meal and gluten feed.

We are of the opinion that if his cows receive 15 lbs. of clover hay they ought to do fairly well on the ration fed, but if they are fresh in milk, or nearly so, we think the following would be a better combination:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay	10.16	.82	4.30	.20
10 lbs. corn stover	5.95	.17	3.24	.07
3 lbs. corn	2.67	.24	2.00	.13
2 lbs. bran	1.76	.25	.77	.06
2 lbs gluten feed	1.84	.41	.97	.07
1 lb. oil meal	.91	.29	.33	.07
Totals	23.29	2.18	11.61	.60

He also asks if it is safe to feed growing heifer calves all they will eat of the above named ration. We would omit corn altogether. They might have clover hay, corn fodder and bran *ad libitum*, unless indeed they should be seen to be taking on superfluous flesh. In this event we would omit the bran and probably the corn stover.

PENNSYLVANIA QUERIES.

E. W. T., Yardley, Pa., has very nice corn silage from corn that would have yielded 70 bushels (shelled) to the acre, with corn fodder and timothy hay to supplement it. He is feeding, in addition, 6 to 7 lbs. of a mixture, by measure, of one-fourth corn meal, one-fourth ground oats, and one-half wheat bran. The cows get about 35 lbs. of silage, and are said to be doing well, and to be in fair flesh. He has to buy corn meal and oats, and asks whether it would pay to buy gluten feed at the same price to mix with the bran.

We are decidedly of the opinion that gluten feed is a more profitable feed for fresh cows than a combination of corn meal and ground oats unless one has alfalfa or hay from other legumes to supply the protein. A ration consisting of 35 lbs. of silage, 10 lbs. of stover, 5 lbs. bran and 5 lbs. of gluten feed would not be excessive, as the following figures will show:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
35 lbs. silage	9.24	.46	4.90	.25
10 lbs. stover	5.25	.17	3.24	.07
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. gluten feed	4.61	1.02	2.42	.17
Totals	23.51	2.28	12.49	.64

Mr. T. also asks for our opinion of alfalfa as a hay for cows. We have never had the opportunity to make personal trial of this forage crop, but have visited herds where it has been used, and have received innumerable letters from parties using it, and all the testimony goes to show that there is nothing superior to it for forage for dairy stock of all kinds. Alfalfa hay contains 11.0 per cent of digestible protein, whereas a mixture of timothy and red clover hay would contain only 4.8 per cent, or less than one-half as much.

DANGER FROM ABORTION.

A Wisconsin subscriber says he will move March 1st to a farm that has been occupied by a herd of cows in which there have been several cases of abortion during the past year. The last case happened some two months ago. The problem with him is how he can ascertain whether this trouble was epidemic or sporadic, and if the former what precautions he shall take before moving his own herd to these premises.

This is indeed a problem. It would probably be no more than safe at least for him to give the stables where this infected herd had been kept a very thorough overhauling and cleaning, and then apply a coat of white-wash, in which there had been mixed enough carbolic acid to give it a very perceptible odor, not omitting to cover the floors and other exposed surfaces and cracks.

RATION FOR A ST. LOUIS MILK COMPANY.

A company producing milk for the St. Louis, Mo., market has a mixed herd of cows weighing about 1,000 lbs. The market affords wheat bran, ship stuff, bolted corn meal, oil meal, corn fodder and clover hay. They ask for a ration formula. Assuming that these cows have not been too long in milk, we suggest for a minimum allowance as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay	10.16	.82	4.30	.20
10 lbs. corn stover	5.95	.17	3.24	.07
4 lbs bran	3.52	.50	1.54	.12
4 lbs. corn chop	3.56	.32	2.67	.17
1 lb. oil meal	.91	.29	.33	.07
Totals	24.10	2.10	12.98	.60

For the heaviest milkers, we would add another pound of oil meal.

The company also asks how much salt to allow each cow. One ounce per day is about the proper amount.

NAME OF STATE OMITTED.

W. E. N. asks for a ration formula from clover hay, brewers grains and canaille. We understand the latter feed to be what is usually termed middlings. If the brewers grains are fresh, we suggest the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
20 lbs. brewers grains	4.86	.78	1.86	.28
4 lbs. ground corn	3.56	.32	2.66	.18
Totals	25.36	2.46	11.68	80

A SOUTH CAROLINA RATION.

E. H. N., Florence, S. C., has cotton seed meal at $22.50; ship stuff at $21; cotton seed hulls, $2.50; pea vine hay, $10; and cow peas, 60 cents per bushel, not threshed out but fed after cooking with the hulls.

Assuming that these peas are not materially different in feeding value from the threshed peas, we recommend him to use as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs pea vine hay	8.93	1.08	3.86	.11
10lbs. cotton seed hulls	8.89	.03	3.31	.17
2 lbs cotton seed meal	1.84	.74	.34	.17
4 lbs. cow peas	3.41	.73	2.17	.04
Totals	23.07	2.58	9.68	.49

AN ONTARIO RATION.

J. B, Murillo, Ontario, has a grade Holstein heifer about to be fresh, which he is anxious to feed to the best advantage. He has mixed clover and timothy hay; can buy wheat bran at $14; shorts at $16; corn meal at $24 and oil cake meal at $20. If there is no mistake in these quotations, the price of corn meal is certainly prohibitory, and as we have often said, we think the bran is preferable to the shorts even at the same price. This makes it necessary to submit a formula substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17 06	.96	7.92	.32
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. oil meal	1.82	.59	65	.14
Totals	24.17	2.30	10.89	.64

GUERNSEY RECORDS AND REGISTRATION.

H. E. Coffin, Berwick, Maine, writes us for information as to the weekly and yearly registered milk and butter records of Guernsey cows and also of Jerseys. He also asks what it costs to get a Guernsey cow and heifer registered.

If he will write to Mr. W. H. Caldwell, Secretary of the American Guernsey Cattle Club, Peterboro, N. H., he will receive answers to these questions. We have not been in the way of keeping a register of the reported records of cows, partly because these records are not reported to us officially, and some of those which we find in the agricultural and breeders' papers are of at least questionable validity.

MAINE RATION.

The same correspondent asks us to give him a formula for Guernsey cows and grades where butter is made and skim milk sold. He has a silo and good quality of mixed clover, timothy and red top hay, but it is worth $18 per ton; can buy mixed feed at $20; cotton seed meal at $26; corn meal at $18; Chicago gluten meal, $23.50; and ground oats at 80 cents (per bag)?

It is hardly necessary for us to say that it is a difficult matter to estimate the relative value of oats at 80 cents per *bag*, and mixed feed at $20 per ton, but the oats have this advantage that we know what they are. We therefore recommend as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17.06	.96	7.92	.32
2 lbs. corn	1.78	.17	1.33	.09
3 lbs. oats	2.67	.28	1.42	.13
4 lbs. gluten feed	3.69	.89	1.94	.08
Totals	25.20	2.29	12.61	.63

SILO QUESTIONS.

I intend to build a silo 12 ft. in diameter, 6 ft. stone and 14 ft. staves; what shall I use for mortar? How thick a wall shall I build? Which is preferable, pine or hemlock? I would like to hear more in regard to hoops or bands, whether ⅝ rods or wire are best, and what size wire? J. T. S.

Edson, Wis.

A good quality of cement is usually used for laying up the foundations of silos. Make the wall 18 inches thick. A good quality of either wood will answer. The ⅝ rods have been used very successfully. Where wire is used it is in the form of wire fencing of good size and quality. The ends are clamped between 2×4s and then bolted together.

THE NEW VALUES FOR GLUTEN FEED.

J. H. W., Parkersburg, West Virginia, in asking for a ration formula says he can buy Chicago gluten feed, guaranteed to contain 27 per cent of protein and 2.25 per cent of fat. He observes that these figures differ from those given in our feeding tables, and wants to know which kind of gluten feed would be the more profitable to buy. It will be remembered in the first place that our tables do not give the total amount of protein in the feeds, but simply the amount of digestible protein which is usually about 86 per cent of the total.

Further than this it may be said that there has been a constant tendency to reduce the amount of crude fat by extracting the corn oil and making an independent commercial product of it. Originally gluten feed contained as high as 12 per cent of crude fat, and this, of course, had a tendency to reduce the per cent of protein very materially. On the whole, we think we would prefer a little less protein and more fat than is now contained in gluten feed. If the figures for this Chicago gluten feed, which was guaranteed to contain 27 per cent of protein and 2.25 per cent of fat, should be substituted in our table they would be 23.2 per cent of digestible protein and 2 per cent of digestible fat. Substituting these figures for those given we would recommend a formula as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
6 lbs. gluten feed	5.53	1 33	2.90	.12
3 lbs bran	2.64	.38	1.16	.09
10 lbs. mixed hay	8 53	.48	3.96	.16
Totals	24.62	2.58	12.22	.58

FOR A LOUISIANA MILKMAN.

G. A. V., St. Bernard Parish, La., has a dairy of fifty-one milk cows, mostly grade Jerseys, and retails the milk in New Orleans. He has been feeding as follows: Two feeds each day, each feed consisting of 3 lbs. wheat bran, 2 lbs. bolted corn meal, 1 lb.

cotton seed meal, 5 lbs. cotton seed hulls and all the hay (which he says is of varying quality), that the cows will eat, giving each cow more or less of the above allowance according to her appetite and freshness in milk.

He asks the pertinent question whether he can do better than this, with bolted corn meal at $16 per ton; cotton seed meal at $22 per ton; cotton seed hulls at $4.00; wheat bran $16.50; rice bran $8 and oats 32 cents per bushel.

If the feeding of this herd was an original proposition we should be disposed to depart quite widely from the scheme now followed; but when cows have been accustomed to a certain regimen changes should be made quite gradually and not be too radical. It may sound a little strange to this inquirer to have us say it, but truth compels the statement that simple ground corn, containing the corn bran and the corn germ, would be worth more to him, pound for pound, than the bolted corn meal and a change of this character could be effected probably without any disturbance in the regular routine. Cotton seed hulls are very dear at $4 per ton and we should be disposed to dispense with them almost all together and rely more upon the hay and rice bran. We see no reason why 3 lbs. of rice bran, 3 lbs. of wheat bran and 2 lbs. of cotton seed meal should not furnish all the grain these cows need or can use with profit, and this grain allowance supplemented with what hay they will eat would be the scheme we should follow as an original proposition. With cows accustomed to the feed that has been given to these cows we should endeavor by degrees to work around to the same allowance, being guided of course all the time by the results.

SOME DIRECT QUESTIONS.

A subscriber in Zanesville, Ohio asks us the following direct questions.

Is the Rockford gluten feed worth $19.40 per ton delivered here, when bran is $16 and hard to get?

Is there a reliable milling firm in St. Paul or Minneapolis that would ship us a carload of bran that could be relied on?

In answer to the first inquiry we have to say that it could hardly be expected of us to endorse without qualification a specific feed product. We have known of parties using this brand of gluten feed with great satisfaction, and judged by its reputed protein content the price is not exorbitant when compared with the price of bran.

The second question might be answered with an unqualified affirmative. We are disposed to believe that it would be difficult to find a milling firm in either of the cities that would not furnish bran of the precise quality they would recommend.

FEEDING MORE THAN IS PROFITABLE.

M. S., Staten Island, New York, is feeding fourteen cows, and wants a milk product of the very best quality that can be produced. He reports himself as feeding at the present time 6 lbs. gluten feed, 8 lbs. wheat bran and all the mixed clover hay they will eat. He is getting an average of 145 quarts of milk per day, and the cows vary from one to sixteen months in lactation.

If these feeds are of average quality his cows are receiving nearly or quite 3 lbs. of digestible protein daily, with other nutrients in proportion. This we believe to be more, as an average, than any herd of fourteen cows can profitably consume.

In the recent report of the Wisconsin Agricultural Experiment Station there is the record of an experiment carried on there, increasing the grain allowance from 8 lbs. per day to 12 lbs. per day, with the result that there was no adequate increase in the production of milk, and, in fact, scarcely any appreciable increase. This record confirms experiments made elsewhere that there is somewhat of a limit to profitable feeding, and indicating that, as a rule, one pound of grain per day for each 100 lbs. of live weight is about all that can be used to advantage. Of course, "circumstances alter cases." If the roughage is straw, or corn stover, or timothy hay, exclusively, it may often be expedient to increase the grain allowance. We are of the opinion that M. S. would find greater profit if he fed not to exceed 10 lbs. of grain daily, to consist of equal parts by weight of gluten feed and bran. Possibly if other feeds were available, there might be still greater economy in making a different selection.

FEEDING ALTOGETHER TOO MUCH.

We are feeding ration of 25 lbs. alfalfa hay, 8 quarts bran, 4 quarts corn meal, 1 quart oil cake meal. Are we doing right?

Fullerton, Cal. L. B. B.

As near as we can estimate L. B. B. is feeding about 35 lbs. dry matter, and this dry matter contains digestible nutrients as follows: 4.24 lbs. protein, 16.93 lbs. carbohydrates, and .98 fat. This is fully 25 per cent more than any herd of cows can eat with profit. Either he has made some mistake in estimating the amount he feeds, or his cows are not eating all he places before them, or, if they do, a large amount of what they eat passes off undigested and does no good. We think the following is an ample allowance for his cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. alfalfa	18.32	2.20	7.92	.24
4 lbs. bran	3 52	.50	1.54	.12
4 lbs. corn	3.56	.32	2.67	.17
Totals	25.40	3.02	12.13	.53

Of course, some may eat more and some less.

G. E. A., New Albany, Pa., is one of our recent trial subscribers, but he says he does not intend to let his subscription run out as long as he is on a farm. He has devised the following formula for a ration to feed his cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. corn fodder	14.87	.42	8.10	.17
6 lbs. bran	5.28	75	2.31	.18
4 lbs. corn meal	3.56	.32	2.67	.17
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	25.55	2.23	13.42	.69

These figures are practically such as we would make and show that Mr. A. has been a student of feeding problems. His cotton seed meal was bought for $20 per ton because it had been in stock quite a while, and had become somewhat baked and lumpy. He says it does not appear to be moldy or otherwise damaged, and tastes all right. He wants to know whether we would advise him to continue its use. If he is quite certain that the meal has not become sour or moldy, we see no reason why he may not continue to use it.

A VERMONT PROBLEM.

I. W. G., of East Calais, Vt., has timothy hay, corn stover and corn and cob meal, and can buy bran at $20.60, cotton seed and gluten meal at $26 and oil meal at $30 per ton. He wishes to feed as much corn and cob meal as possible. His cows have warm water once a day, are fed twice daily and are salted with each feed. He does not state whether his cows are fresh or whether they have passed their period of maximum flow. On the theory that he wants to feed a full ration we would suggest the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. timothy hay	10.42	.34	5.21	.17
10 lbs stover	5.95	.17	3.24	.07
4 lbs. corn and cob meal	3.56	.26	2.52	.14
3 lbs. bran	2.64	.38	1.16	.09
2 lbs. cotton seed meal	1.84	.74	.35	.17
1 lb oil meal	.91	.29	.33	.07
Totals	25.32	2.18	12.81	.71

If Mr. G's cows are of the proper dairy temperment and have not been too long in milk, we feel quite confident that it would pay him to feed them substantially as above indicated, although such a ration may have the appearance of being expensive. If he tries this ration we beg him not to be too hasty in his judgment, or to base it upon opinion merely, but make a record of what the cows are doing now, and then continue the record and see if the cows are really making a profit on their feed.

When the stover is gone the only change to be recommended is to increase the amount of hay so as to satisfy the appetite of each cow.

SEVERAL NEW YORK INQUIRIES.

H. L. A., McDonough, New York, asks first for a ration for fresh cows. He has on the farm plenty of mixed hay and corn stover. Yellow meal is worth 75 cents per hundred; hominy chop, 90 cents per hundred; oats, 35 cents per bushel; bran, $17.25 per ton; Buffalo gluten feed, $20 per ton; oil meal, $1.60 per hundred and cotton seed meal, $25 per ton. He makes butter and wants to feed so as to realize the most money from a dairy of nineteen cows. For a minimum allowance we think the following formula is about as economical a ration as he can expect to have:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. mixed hay	13.80	.72	5.94	.24
5 lbs stover	2.98	.09	1.62	.04
4 lbs. bran	3.52	.50	1.54	.12
4 lbs gluten feed	3.69	.82	1.73	.14
Totals	23.99	2.13	10.83	.54

Doubtless some of his cows would require for most economical production an addition of 25 to 50 per cent to the grain allowance above specified. How much to give each cow can only be determined by daily observations and a daily record of the amount each cow returns.

He also asks for some advice about building a silo. He wants to feed twenty or more cows, besides ten to fifteen head of young stock. A silo for this number of cattle should be at least 20 feet in diameter and 24 feet high and would then hold only enough for winter feeding. The tendency in later years is to build smaller silos and more of them so as to have silage for the drouth in summer. Two silos, 16 feet in diameter and 24 feet deep, will hold approximately 175 tons of silage. A silo 20 feet in diameter and 24 feet deep will hold 135 tons.

He asks whether to build of staves or if it is best in the end to use woven wire fencing. This is a question not yet fully determined. The woven wire fencing so far as it has been used answers an excellent purpose. However, its durability for a number of years remains, perhaps, to be determined. We should not hesitate to use it and run the chances. A stave silo could not well be built with two thicknesses of boards in place of 2 inch staves.

FOR PENNSYLVANIA JERSEYS.

"A Young Farmer" of Bryn Mawr, Pa., writes that he has a herd of thoroughbred Jerseys, and is now feeding, on an average, 34 lbs. of good corn silage, 5 lbs. of good Hungarian grass, 7 lbs. of wheat bran and 3 lbs. of corn and cob meal per cow daily, varying as the condition of the cows vary. He reports a quantity of oil meal on hand kept over from last year in a dry place, and inquires if this is still good to feed.

We think the ration he is using is somewhat deficient in digestible protein, and we would recommend that he add thereto 1 lb. per day of the oil meal. There is no controlling reason why this oil meal should not be nearly or quite as good now as when purchased. Smell and taste and the judgment of the cows will determine this point very satisfactorily.

A VIRGINIA RATION.

C. V. W., Leesburg, Va., has fifty head of grade Jersey cows ranging in weight from 700 to 1,000 lbs. He has silage, stover, wheat straw, some oat straw and no hay. Bran costs $20 per ton, corn and cob meal $14, corn meal $16 and cotton seed meal $26. He asks whether he can get a ration out of them.

We should omit corn meal altogether, and we know no good reason why cotton seed meal should cost $26 any where in the country, and least of all so near the source of production as any place in Virginia. This price seems to us proof positive that there are either too many middlemen or that those who are acting as such are making altogether too large profits.

Our suggestion for a formula would take substantially the following form:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. corn stover	5.95	.17	3.24	.07
5 lbs. oat straw	4.54	.06	1 93	.04
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. cotton seed meal	1.84	.74	.33	.17
Totals	26.01	2.06	13 06	.72

This formula gives more coarse fodder than many of these cows will eat, perhaps more than any of them will eat. In that

"Honor is Purchased by Deeds We Do."

Deeds, not words, count in battles of peace as well as in war. It is not what we say, but what Hood's Sarsaparilla does, that tells the story of its merit. It has won many remarkable victories over the arch enemy of mankind—impure blood. Remember

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Weak Lungs

When your throat and lungs are perfectly healthy you needn't worry about the germs of consumption. They don't attack healthy people. It's the weak, debilitated, inflamed membranes that are first affected. Hard coughs and colds weaken your throat and lungs and make consumption more easy.

If your lungs are weak

Scott's Emulsion

is the best remedy you can take. It soothes and heals and gives tone and strength to these delicate membranes. In this way you can prevent consumption. And you can cure it also if you haven't had it too long. Keep taking it until your lungs are strong and your weight restored.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

event unless the leavings are the coarsest part of the stover and straw we should reduce the amount until they will eat up what was placed before them reasonably clean.

A KANSAS RATION,

C. S. S., Nortonville, Kansas, has wheat bran at $13 per ton; shorts at $14 per ton; corn, 25 cents per bushel, and ground at home; clover hay, $3.00 per ton; and kafir corn fodder the same, both of which he has on the farm.

If there is plenty clover hay, and other stock to eat the kafir corn fodder, we should advise feeding the cows clover hay exclusively, or at least giving them all the clover hay that the amount on hand will warrant. The necessity for doing this is seen in the formula, which we submit as follows:

10 lbs. clover hay.....	8.47	.68	3.58	17
10lb ..kafir corn fodder	5.97	15	3.73	.04
5 lbs. bran.....	4.41	.63	1.93	.15
5 lbs. corn & cob meal	4.45	.32	3.15	.18
Totals.....	23 30	1.78	11.39	.54

It will be seen that the protein n the above formula is much below the standard, and that if clover hay was substituted for the kafir corn, the ration would take on a much better appearance.

A NOTABLE GAIN.

I shall have to come to you again for a balanced ration, as the one you gave me last winter was so good my five cows gained fifty pounds of milk a day on it. I have clover hay for morning and night and corn stover for noon. Corn, 40 cents a hundred; oats, 21 cents a bushel; bran, $15.00 a ton; and gluten feed, $17.00 a ton.

Warrens, Wis G. W. F.

If these cows did so well last year, why not try the same combination that was given them then? If that is for any reason unavailable, we suggest the following as the minimum allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay....	10.16	.82	4 30	.20
8 lbs. corn stover....	4.76	.14	2 59	.06
5 lbs. oats.....	4.45	.46	2.37	.21
4 lbs. gluten feed....	3.69	82	1.94	.14
Totals	23.06	2 24	11.20	.60

It would not injure this formnla in the least to add, say, 2 lbs. of ground corn to the allowance of grain specified.

ONTARIO FEEDING QUESTIONS.

P. P. F., of Amprior, Ontario, is a new subscriber and he has corn fodder, carrots, clover hay and oat hay all of his own raising and can buy bran for $14 per ton. He asks us to give him four different formulas with different combinations of the above named feeds. It is hardly practicable at this time, with the demands upon our space, to do this. We, however, submit the following formula which will be a fair guide for the different combinations:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
8 lbs. corn fodder....	5.68	.30	3.23	.10
10 lbs. oat hay.....	9.11	.43	4.64	15
20 lbs. carrots.....	2.28	.16	1.56	.04
10 lbs. bran.....	8.81	1.26	3.86	.30
Totals.....	25.88	2 15	13.29	.59

Clover hay is somewhat better than oat hay, and if used in the place of it, would make a better ration but does not call for a specific change. On the whole it would be better to feed the two kinds of hay simultaneously and not all of one kind or all of the other.

CORN CHOP BETTER THAN CORN MEAL.

D. H. J., Xenia, Ohio, writes that he has just purchased a retail milk route with fixtures complete. He is milking twenty-nine cows, several of them strippers and is getting from 62 to 65 gallons of milk per day. He is feeding 4 lbs. of wheat bran, 4 lbs. of fine corn meal, 2 lbs. of oil meal and all the good fodder and millet hay the cows will eat and adds that if there is any chance for improvement he would be thankful to have it.

The first suggestion we have for this inquirer is that simple ground corn is a better feed for his cows than fine corn meal and probably cheaper. We think it would be good policy for him to ascertain if he could not get some feed to take the place of so much oil meal and cost him less money. To this end, let him look up the probabilities of getting cotton seed meal or gluten meal or dry brewers grains, and if he desires to submit a second inquiry stating the feeds which are available we shall take great pleasure in replying as best we can.

AIR BLAST CHURNS.

I have just received circulars describing a machine called the Air Blast butter separator, one ot which I enclose. I wish to ask if you know anything of this invention, and if you believe it will do all that is claimed for it? If it is not misrepresented in the circulars, it seems to be a practical and inexpensive machine, and one that would be valuable to dairymen, living in localities remote from a creamery. C. S. P.

San Jacinto, California.

We have several times made reference to this class of dairy implements, in the columns of the DAIRYMAN, and always adversely. We have seen no reason to change our opinion. There is nothing in any churn of this class that makes it superior or as good as the common box or barrel churn, in yield of butter, nor is it any advantage to bring the butter in one or five minutes. It may be taken as a rule, that any butter that comes in less than 30 minutes will not have a fine grain, and is liable to be slushy or salvey.

The forcing air through cream is nothing new; it has been tried and given up many times. We note that the circular claims that after the butter has been removed by this churn, the remaining cream (?) can be used for coffee. We should suppose that sweet cream with the butter fat removed would be skim milk, hardly a valuable addition to a cup of coffee.

GLUTEN FEED.

I sent to commission merchants at Peoria for gluten meal. They sent me one ton of feed from the Atlas Distillery, labelled on the sacks, "Cooked and steam-dried gluten meal." As it had a peculiar odor, I became suspicious that perhaps it was not gluten meal and send sample and ask if it is such. If not, what is it, and will it do to feed cows for butter making? E. H. H.

Hamilton, Ill.

The sample received is what is known as Atlas Gluten Feed, (not meal) and has been well spoken of by those who have used it.

It is an excellent feed for cows and will not have any bad effect on the butter when fed in the proper quantities.

FAT AND BUTTER YIELD.

I send you a copy of my milk statement for the 1st half 11th month. How much butter has been made from the amount specified, and how much should a 4% test make? Milk, 1841 lbs.; test, 4%; total fat, 73.6 lbs.; value fat, 22½ cents per lb.; equal to $16.56.

I am a patron of the ——— ——— ———. They charge 4 cents for making; the buttermakers at the factory tell me their yield is over 5 lbs. E. S.

———, Wis.

The 73.6 pounds of fat would make about 85.8 pounds of butter, with slight variations either above or below according to conditions. Four per cent milk should give about 4.6 pounds of butter.

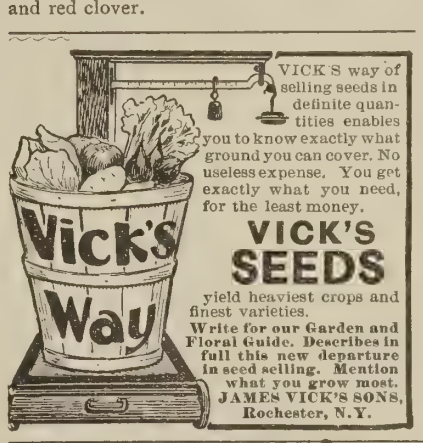
They may be getting a large amount of milk that runs much higher than 4% and if so, can easily have a factory yield of five pounds of butter, without causing you any injustice.

COMBINED CHURNS AND BUTTER WORKERS.

A Pennsylvania subscriber asks if these machines are successful. He has had some not altogether satisfactory experience with one, and inquires whether the fault is with the machine or with the operator.

Of course we cannot decide in a particular case who is to blame. We only know that these churns are now accepted by creamery men all over the country as the ideal butter making machine. We think it takes a little more care and a little more judgment to operate them successfully than it does the seperate churn and butter worker, but the very highest grade of butter has been and can be at all times made in the combined machine.

FLOODED CORN FOR SILAGE.



Sometime since we had an inquiry from the Pacific Coast as to whether a man could safely count on growing corn on a river bottom where there was apt to be once in four or five years, a summer flood. We answered it as best we could under the circumstances, and are now in receipt of the following bit of experience from a friend in Ohio:

"We have had experience with flooded corn for silage for two years. The very first corn I put into the silo, was much of it washed down flat just as it was maturing. The cows ate it in the form of silage all right and failed greatly in their milk when it played out the following December. Since then our corn was again flooded when we were just about one-third done filling silo. Could not see any difference in silage. The cows ate it as well and did as well on the part that had been flooded as on that that had escaped. Much of it was flooded way above the ears. We husked some of it and the cows seemed to prefer death to eating the dry fodder, or stover as you call it."

SEEDING FOR PASTURE.

F. J. G., Rural Mail Route No. 2, Grand Rapids, Mich., asks about seeding, and what kind of grass seed to sow on a certain twelve acres which he wishes to devote to a permanent cow pasture.

In a general way this question is properly answered by saying, sow all kinds. If Kentucky blue grass, more generally known throughout the Northern states as June grass, is as indigeneous in Michigan as it is in Wisconsin there will be little need to use this kind of seed, otherwise we should include it in the mixture with timothy, red top and red clover.

VICK'S way of selling seeds in definite quantities enables you to know exactly what ground you can cover. No useless expense. You get exactly what you need, for the least money.

VICK'S SEEDS

yield heaviest crops and finest varieties.

NOTES.

N. G. Johnson, of the Maryland Agricultural Exp. Sta., telling the Society for the Promotion of Agricultural Science the story of his fight with the pea louse, represented that the pea raisers in his state had lost last year more than three million dollars by the ravages of this insect. A parasite has been discovered which practically annihilated the pest, but the discovery was not made in time to save the crop in some parts of the state from destruction.

The question of peas is becoming more and more a matter of great moment to the dairy farmer, and it is to be hoped that the parasite spoken of by Mr. Johnson will be introduced and studied by all enterprising dairy farmers.

Switzerland exports regularly more than seventeen different kinds of cheese. The United States exports only three: The Cheddar, the Swiss and the Limburger.

ABORTION.

We have a letter from a Washington correspondent, which records a very deplorable condition in his herd, resulting from what appears to be epidemic abortion, that has broken out in the last year. We think he is mistaken in denominating the patches seen on the afterbirth, as ulcers. These are probably only the cotyledons or "buttons," which are always found, even in cases of normal parturition.

We hardly know what to say to this correspondent. It is practically useless to refer to the ordinary veterinarian, for, unfortunately, he has not kept up with the later developments in regard to this trouble. As we said last week, the different remedies advertised in our columns have proved efficacious in many instances, and in others they have seemed to be practically worthless. It may be that anyone of them tried in this herd would be satisfactory, but this cannot be guaranteed; and as we have said, if we had this trouble in our herd to contend with, we should be disposed to try the carbolic treatment there referred to. We do not despair, as many do in these matters, for our own experience is, that the trouble wears itself out after a year or two. This does not mean that we would keep over ordinary cows that are troubled this way, but it does mean that we would not sacrifice a first-class cow, because for two or three successive years she failed to carry her calf the full time.

THE VITAL QUESTION OF PURE FOOD.

The American *Review of Reviews* for January contains a trenchant article on the above question from the pen of Harry B. Mason, Ph. D.

Mr. Mason takes up the astounding disclosures made before the Senator Mason's committee, which held frequent sessions in various parts of the country last summer. Before this committee it was proved that the public purse is defrauded and the public health is damaged by counterfeit butter; how coffee is found to consist mainly of molasses and flour molded into berries; how fully 70 per cent of beer is made without malt; how the color of tea leaves, pickles and canned vegetables is made with copper salts; how condensed milk is made from skimmed milk effectually ridden of a large part of its nutritious material; how spices are not spices, sardines are not sardines, and how fifteen-year-old whisky is made in fifteen minutes.

Chemists of experience, among whom was our own Dr. Mitchell, of the Wisconsin Dairy and Food Commission, testified that antiseptics and preservatives are used indiscriminately to defraud and deceive, and that these compounds are always harmful, and sometimes "positively dangerous." Milk and butter are preserved with "freezine"—a solution of poisonous formaldehyde. Butchers use these fluids too on choice scraps of meat, which are finally made into "Hamburg steak" and sausage.

The report of the Connecticut Experiment Station shows that of 63 samples of fruit jelly examined last year, 43 were adulterated and spurious; 46 out of 49 samples of jams and marmalades were found adulterated and spurious, and of 574 samples of spices, 41½ per cent were adulterated, admixed or spurious.

Concerning this most damnable state of affairs Mr. Mason says:

"This neglect of the public health has enabled manufacturers of foods and drinks to go to unlimited lengths in the adulteration and cheapening of their products, regardless alike of the public purse and the public health. Their greed has had no check; their dishonesty has received no punishment. They have flourished and grown fat at the expense of the people who have consumed their inferior, counterfeited and harmful products. This is not indifferent; it is further reaching in its effects than a cursory thought indicates. Reflection must convince any thoughtful man that the prevalent consumption of inferior and harmful foods by a people must result in the physical and moral deterioration of that people."

He then remarks upon the way such crimes are looked upon by the law and the courts in England and says:

"If any food stuff is sold under deceit in England, the manufacturer or the dealer, as the case may be, is fined on conviction. There is no arbitrary standard of purity to which any product must conform; every product *must be* what it pretends to be; if it is sold as "pure olive oil" it must be olive oil; if it masquerades as butter it must be butter. Every product must be "of the nature substance and quality" indicated by its label or asked for, directly or indirectly by the purchaser. To make this law effective every township and borough has its "public analyst," who examines suspected samples of food stuffs submitted to him * * * * and the testimony of this public analyst is alone sufficient to convict the defendant. What is the result? The adulteration and misbranding of food stuffs in England is insignificant compared with the extent of the evil in the United States. Of 211 samples of foods examined in Halifax borough 7 were adulterated; of 152 samples recently examined in Bristol 11 were adulterated; of 35 samples examined in Hertfordshire 2 were adulterated.

* * * * * * *

But of these 398 samples of suspected food stuffs only 13 per cent were adulterated. Compare this 13 per cent of adulteration found in *suspected* food in England with the 45 per cent found in Connecticut."

Now a word to the readers of HOARD'S DAIRYMAN on their duty in the premises. We ask you to buy 25 postal cards and use them up the present winter in writing to your member of Congress and U. S. Senators. Speak plainly on the matter. Tell them you want them to support a bill like the Grout Bill now before the House which places oleomargarine under the control of the police powers of the state without the protection of the original package decision of the courts and adds a tax of 10 cents a pound on all oleomargarine that is colored to resemble butter.

Every man of you has influence. If he does not use it in the way we have indicated he is not doing his duty as a dairyman and a citizen. It is almost a crime to be able to do good and refuse the service.

Such writing of postal cards will move the members of Congress as nothing else will.

WISCONSIN DAIRYMEN'S CONVENTION AT WATERTOWN, FEB. 13 to 16, 1900.

The program for this convention now being distributed contains the following features:

TUESDAY, FEBRUARY 13.

Opening Session, 7:30 p. m.—Address of Welcome by the Mayor; Response by ex-President Hoard; remarks by others.

WEDNESDAY, FEBRUARY 14.

Morning Session, 9:30 a. m.—President's Annual Address,
H. C TAYLOR, Orfordville.
Danish System of Butter Exhibits,
Prof. W. F. WOLL, Madison.
Reports of Cheese Instructors,
E. L. ADERHOLD.
U. S. BAER.

Afternoon Session, 2:00 p. m.—Experience in Breeding a Dairy Herd,
C. P. GOODRICH, Fort Atkinson
(The way to have a profitable dairy is to breed profitable cows.)
One Way to Develop a Dairy Cow,
MRS. ADDIE F HOWIE, Elm Grove.
(Mrs Howie is one of Wisconsin's enthusiastic and successful dairywomen)
How My Cows Were Cared for and Fed,
JAMES H. BEIRNE, Oakfield.
(Mr. Beirne has cows that produce over 900 lbs. of butter in 12 months.)

Evening Session, 7:30—Music, addresses, recitations, etc.

THURSDAY, FEBRUARY 15.

Morning Session, 9:00 a. m.—Who Should Use the Babcock Test, and Why?
Prof. E. H. FARRINGTON, Madison.
Watering the Dairy Cow. (An important but much neglected subject)
E. C. BENNETT, Tripoli, Iowa.
Feeding the Dairy Cow for Profit.
PROF T. L HAECKER, Minnesota.
Afternoon Session, 1:30 p. m.—American Dairying at the Paris Exposition.
MAJOR H. E. ALVORD, Chief of Dairy Division U. S. Department of Agriculture.
The Claims of the Cow as a Mother.
W. D. HOARD, Ft. Atkinson.
Announcement of Scores
Thursday evening, Banquet (Special program).

FRIDAY, FEBRUARY 16.

Morning Session, 9:00 a. m —Boards of Trade. How to Organize and Conduct Them in the Interest of the Producer.
WILL THOMAS, Sheboygan Falls.
The Present Status of the Silage Question.
PROF. W. A. HENRY, Madison.
Opening the Question Box
Reports of Officers and Committees.
Afternoon Session, 1:30 p. m —Judging the Dairy Cow, (Illustrated with one or more living subjects.)
PROF. CARLYLE, Madison.
The Oleomargarine Situation.
H. C. ADAMS, State Dairy and Food Commissioner.
Shall the Dairyman Have an Apple Orchard? A. J. PHILIPS, West Salem.

PREMIUMS.

The premium list aggregates five hundred dollars in cash, distributed as follows: $350 for butter and cheese, and $150 for herd premiums, details of which we published on page 932.

For copies of the program and any further information address G. W. Burchard, Secretary, Fort Atkinson, Wis.

MORE COFFEE FACTS.

Study the Question Yourself.

"When the doctor said 'no more coffee,' I was dismayed, for as an ardent lover of coffee and a crank in the matter of its preparation, I had grown to believe that life was not worth living without it, but the dull stupidity and the almost daily headache so interfered with my profession (literature) that I was compelled to seek the doctor's advice.

"I saw an improvement from the start, but missed my morning beverage and felt a great lack. It was at the home of a friend and Postum apostle, Mrs. ———— of Lonsdale, that I tasted my first Postum. Her family had sworn by it a year or more, and declared themselves, from the least to greatest, benefitted by its use.

"I was surprised to find it really palatable, and determined that I could improve on it myself. I purchased a box, and as we all do on the first trial, made a lamentable failure of it, through insufficient boiling, and the Postum was poked away on an upper shelf, until the oft reiterated newspaper statements made me determine to try it again, with long boiling.

"I took twenty-five minutes to prepare it, about ten minutes to bring it up to a boil, and then allowed it to boil steadily for fifteen minutes, and from the first sip, I was enthusiastic over the new beverage, and even wanted a second cup. It has never palled upon me, morning or night. Nothing could induce me to go back to the berry coffee.

"The change Postum has wrought in me seems little short of miraculous. For the first time in many years, I am really well, my color has freshened, headache has not visited me for many weeks, and my ability for work has returned with all its old zest. I shall never cease to be grateful for what I feel is a remarkable cure due to nothing more than Postum Food Coffee, in place of the oriental berry.

"Sincerely yours," Mrs. R. B. Tallman, Centredale, R. I.

WHAT IS THE REASON?

Why is it that you are not equal to the task Nature sets for you to do?

Why do you find weakness stealing over you and growing day by day?

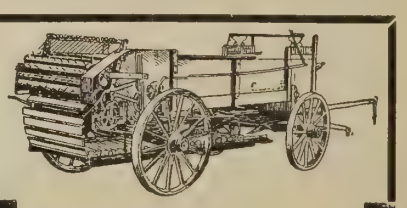
Why that ashy, chalky complexion?

Why that inability to hold your urine?

Why those distressing pains across your back?

All these symptoms are unmistakable evidences of kidney trouble.

The kidneys, that make the human engine of life move as Nature intended, are not working properly and should have prompt attention.



If you need a medicine for kidney, bladder or uric acid trouble, you can make no mistake by using the famous new discovery, Dr. Kilmer's Swamp-Root. It gives quick relief, and cures the most distressing cases.

Hospitals use it in all kinds of cases, especially severe and urgent ones. Doctors prescribe it freely in their practice and in their families, and use it when they need a kidney and bladder tonic themselves.

Tens of thousands of grateful patients have written to Dr. Kilmer & Co., and these letters have been fashioned into a handy volume of ready reference, which should be in every household. This volume and a sample bottle of Swamp-Root will be mailed to any reader of this paper who will send name and address to Dr. Kilmer & Co., and state that he saw this offer in HOARD'S DAIRYMAN.

If there is any doubt in your mind as to your condition, take from your urine on arising, about two ounces, place it in a glass or bottle and let it stand twenty-four hours. If, on examination, it is milky or cloudy, if there is a brick-dust settling, or if small particles float about in it, your kidneys are in need of immediate attention.

Swamp-Root is for sale everywhere in bottles of two sizes and two prices, fifty cents and one dollar. Remember the name, Swamp-Root, and the address, Binghamton, N. Y.

New American Manure Spreader.

Fits your old wagon gear. Pulverizes and spreads all kinds of manures, including stalks. Regulated by one lever to feed any quantity desired. Easy for one man to set up and work. Easy for one team to handle. Send for booklet "E."

AMERICAN HARROW COMPANY,
Detroit, Mich.
Wis. Rep., Madison, A. F. MANNING.

WANTED Agents for the **Roney Hay Fork Returner** and **Seibel's Wind Mill Lubricator.** Mill oiled from ground. RONEY RETURNER CO., Box D, Independence, Iowa.

Cherry's Feed and Litter Carrier

The greatest labor saver ever invented. Send for illustrated catalogue to D. B. CHERRY & CO., Knoxville, Marion Co., Iowa.

The Hand Separator.

ED. HOARD'S DAIRYMAN:—I wish to join issue with you in regard to your answer to C. F. C., of Knapp, Wis., in DAIRYMAN of Dec. 22. The article is headed "A Hand Separator." I own a U. S. separator and it has been in constant use for nearly three years, twice a day. I also have a Babcock tester and have made repeated tests of the skim milk under varying temperature and speed, using the double neck Ohlson bottle and have never found to exceed 0.03% of fat lost and that only with a speed of 45 revolutions of crank per minute. At 50 revolutions it read 0.02%. I have tested skim milk from the so-called gravity separator and found 0.60%, or a loss of one pound in seven if a cow tests 4.2%. At the time I purchased my separator, we were milking seven cows and I am sure it paid for itself the first year. We now have eleven.

As to repairs, it has only cost a few rubber rings and a gallon of oil each year. I honestly believe six cows and a U. S. separator to be equal to seven cows and no separator, and therefore the sooner C. F. C. gets a separator the better it will be for his pocket. and all things considered I think the U. S. is the best. I am not interested in the sale of any separator, but for C. F. C.'s own benefit. I trust you will give him the above article through the columns of the DAIRYMAN.

C. M. SHERMAN.

West Lebanon, N. Y.

We are glad that our correspondent is doing such good work with his separator, but we do not see where the issue comes in. He has only added his testimony to the value of a hand separator, all of which we heartily endorse. But it must be remembered that all men are not equally skillful with tools and we still incline to the belief that the average separator work is not below 0.1% of fat.

Milk Fever and Continuous Milking.

ED. HOARD'S DAIRYMAN:—In your issue of Jan. 5th, you ask for information in regard to continuous milking to avoid milk fever.

I only know of one or two cases. My neighbor had two cows (Holsteins) that were very heavy milkers. They milked up so close to calving that he was afraid to dry them off, so continued. No fever, but a decrease of milk yield from the previous period of lactation. Jas. M. CORP.

Kent, Wash.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The entire offering of butter on Monday's Board of Trade aggregating 8,640 pounds, was sold on call at 24½ cents. Bidding opened at 23 cents but rapidly advanced to the selling figure. The quotation committee decided not to disturb the selling price of last week and declared the market firm at 24 cents.

The sales made were:

Factory.	*Pounds.*	*Price.*
Red Clover	1,800	24½
McConnell	700	24½
Hinckley	2,100	24½
Little Rock	1,020	24½
Shabbona	1,500	24½
DeKalb	1,500	24½
Totals	8,640	

The sales of the corresponding week of the three preceding years were as follows:

Jan. 23, '99, 4,620 pounds of butter sold at 18c.
Jan. 24, '98, 24,300 pounds of butter sold at 19c.
Jan. 25, '97, 25,980 pounds of butter sold at 19½@20½c.

The New York market was reported steady at 25 cents. H. C. B.

Elgin, Ill., Jan. 22, 1900.

DAIRY MARKETS.

ELGIN, Ill., Jan. 22—Butter—144 tubs offered, all sold. Market firm at 24c.

CHICAGO, Ill., Jan. 22—Butter—Extra, creamery, 24½c; firsts, 23@24c; seconds, 20@22c; imitation creameries, 20@22c; dairies, choice to fancy, 22c; firsts, 20c; ladles, fine, 17@17½c; roll, 17@17½c.

Cheese—Full cream, Twins, good to choice, 11½@12c; off grade, 8½@10½c; Young America, 12@12½c; Cheddars, 11½@12c; Swiss, 12¼@12½c; Limburger, 10@11c; Bricks, 1c@11c.

Eggs—Strictly fresh-laid, cases returned, 17c; city cooler stock, 8@10½c; country, 5@8c.

Bran—Scarce and salable at $12.25@12.50 per ton.

Middlings—Dull and sold at $12 per ton.

Cattle—Most of the desirable beef cattle sold 10@20c higher than the close of last week, but the market closed weak, with part of the advance lost. Good cows and heifers advanced 10@15c, and canning stock ruled steady. No strictly choice steers were offered, the best on sale selling at 6.25 with only five lots above 6, and the bulk at 4.85@5.85. Fancy beeves would sell around 6.50@6.60. Thin, 950@1,200-lb. steers sold at 4@4.50. Straight Texas steers sold at 4.05@4.60, and Texas bulls and oxen at 3.45@4; native cows, principally, 2.70@3.50; heifers, 3.50@4.10; bulls, 2.80@4.50; stags, 3.65@4.70; calves, 5@7.75, and feeding cattle, 3.35@4.75.

MILWAUKEE, Wis., Jan. 22—Butter—Creamery, Fancy prints, per lb, 25c; extras, 24c; firsts, 20c; seconds, 18c; roll, 16@17c. Dairy, selections, 20@21c; lines, 16@18c. The market is easy, but fairly active, with offerings in excess of requirements; receipts 5,105 lbs.

Cheese—American Full Cream, Oct. flats, 11½@12½c; Nov., 11@11½c. Brick, 10@10½c. Limburger, 10½@13c. Swiss, Drum, 12½@13c; block, 13@13½c: No. 2, 10½@11c. The market is quiet and unchanged; some winter made brick and Limburger in the market and sells 1@1½c below fall made; receipts 1,640 lbs.

Eggs—Fresh, per doz, 16@17c, loss-off cases returned; held, 10@12c; cold-storage, 9@11c; seconds, 5@8c, as to quality. The market is weak, but prices have not been changed; offerings of fresh are increasing, and cold-storage supplies are very dull; receipts, 180 cases.

BOSTON, Jan. 22—Butter—Creamery, extra, 26c; western extra, 25c; dairy extra, 23½c; imitation creamery, 22c; western ladle, 21c; print creamery, 26½c; box creamery, 26c.

Eggs—Fancy near by, 22@23c; choice fresh, 20@21c; Michigan extra, 20c; western, 19c; fair to good, 16@17c.

CINCINNATI, O., Jan. 22—Butter—Quiet; 25c.

Cheese—Quiet, firm; good to prime Ohio flat, 12½c.

Eggs—Firm; 16c.

NEW ORLEANS, La., Jan. 22—Butter—Market quiet, 25@@26c.

Cheese—unchanged.

Eggs—Storage eggs, 10c.

WASHINGTON, D C., Jan 22—Butter—Market steady. Extras, 25c; firsts, 23@24c; choice imitations, 20@21c.

NEWARK, N. J., Jan. 22—Butter—Market steady; extra creameries, 25c. Other grades more plentiful.

ST. LOUIS, Mo., Jan. 22—Butter—Steady; creamery, 20@25c; dairy, 16@20c.

Eggs—Steady: 15½c.

KANSAS CITY, Mo., Jan. 22—Butter—Creamery, 20@23c; dairy, 18c.

Eggs Fresh 13c.

BALTIMORE, Md., Jan. 22—Butter—Market steadier; creamery separator, extra, 27@28c; extra, first, 25@26c; creamery, first, 25c; creamery, imitation, extra, 23@24c; Iowa & Northwestern ladle, extra, 21@22c; extra, first, 20@21c; first, 20c; Western store packed, 16@18c; creamery rolls (2 lbs.), 27@28c.

Eggs—Market steady; strictly fresh stock, 18c.

PHILADELPHIA, Pa., Jan. 22—Butter Solid packed separator creamery, extra, 25c: firsts, 24c; seconds, 21@22c; imitation creamery, extra, 22c; firsts, 21c; seconds, 20c; ladle packed, extra, 21c; firsts, 20c; seconds, 18c; print butter, creamery extra, 25c; firsts, 24c; seconds, 22c.

Eggs—Pennsylvania and near-by, 21c; Western, 21c; Southwestern and Southern, 20c.

NEW YORK, Jan. 22—Butter—Creamery, Western extras, 25c; firsts, 23½@24c; state extras, 24@25c; firsts, 23@23½c.

Cheese—State, full cream, large or small, fall made, fancy, 12¾@13c.

Eggs—State, Pennsylvania and Western, 21c.

NEW YORK MARKET.

NEW YORK, Jan. 20—Butter—Receipts for the week, 30,262 packages. Exports for the week, none.

Extra fresh Western Creameries were marked down to 25c on Monday and under fairly active trading and moderate receipts this price was well sustained and is firm at the close. There was less inquiry for fresh imitation and ladle butter and lower prices; some sales of finest are reported at 21c but the bulk of the business was done at 20c for best, and 17 to 19c for fair to good lots.

New York State Dairy is coming very sparingly, finest tubs sold on arrival at 23@24c and under grades at 18@22c. June make creamery selling in a small way at 23@24c and other qualities neglected. We quote:

Creamery, extra, 25c; medium, 23½@24c; poor, 22@23c; dairy, 23@24c; medium, 20@22c; poor, 17@19c; ladle, extra, 20@21c; medium, 18@19c; poor, 16@17c.

Cheese—Receipts for the week, 10,069 boxes. Exports for the week, 8,364 boxes.

Exporters bought 1,500 boxes Full Cream Cheese at about 11¾@12c and say 1,600 boxes Skimmed at prices ranging from 8@10c. There was a little more doing in late make Full Cream Cheese to home trade, most sales were at 11@11½c with few of the best marks going at 11¾@12c. Market closes firm with every promise of better business later on. We quote:

Full Cream, small, extra, 12½@13c; medium, 11½@12c; poor, 10½@11c. Full Cream, large, extra, 12¼@12½c; medium, 11½@12c; poor, 10½@11c.

Eggs—Receipts for the week, 40,444 cases.

Strictly fresh stock is all wanted at full prices. Long held stock of all grades continue in full supply, freely offered at low and irregular prices. We quote:

New York & Penn., strictly fresh, per dozen, 21@22c. Northern and Western, strictly fresh, 21c. All other grades, so called fresh, 10@18c. Limed eggs, 12@14c. DAVID W. LEWIS & Co.
177 Chambers St.

Latest quotations for fancy creamery: Buffalo, 26c; St. Paul, 24c; Minneapolis, 24c; Detroit, 24c.

LIVERPOOL, Jan. 22—Butter—Finest United States and good nominal.

Cheese—American finest white, 57s 6d; American finest colored, 59s.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Creamery Plant For Sale—Line of three creameries in Dane Co., Wisconsin, all in first-class shape, latest improvements, etc., doing a good business. Satisfactory reason for selling. To the right party will sell on favorable terms. For particulars apply to M. L. BROWN & CO., 141 So. Water St., Chicago, Ills. 50-tf

Wanted—Registered, service Guernsey bulls. M. D. CUNNINGHAM, Kansasville, Wis.

Guernsey Calves For Sale—Best blood of two Exp. Sta. tests. BLACK & BROS., Mt. Vernon, Ind. 48-3

New 20th Century De Laval "ALPHA" Cream Separators.

A week ago we announced the introduction of the NEW 20th CENTURY "Alpha" De Laval Separators. The new sizes, capacities and prices are as follows:

FACTORY or CREAMERY STYLES.

Standard "Hollow-Bowl" Belt-Power,	1,300 lbs.	$ 200.—
Standard "Hollow-Bowl" Steam-Turbine,	1,300 "	225.—
"Alpha" Acme Belt-Power,	1,750 "	350.—
"Alpha" Acme Steam-Turbine,	1,750 "	375.—
"Alpha" No. 1 Belt-Power,	3,000 "	500.—
"Alpha" No. 1 Steam-Turbine,	3,000 "	525.—
"Alpha" No. 2 Belt-Power,	4,500 "	750.—
"Alpha" No. 2 Steam-Turbine,	4,500 "	800.—

"BABY" or DAIRY STYLES.

"Hollow-Bowl" "Baby" No. 1,	150 lbs.	$ 50.—
"Alpha" Strap "Humming-Bird,"	175 "	50.—
"Alpha" Crank "Humming-Bird,"	225 "	65.—
"Alpha" Iron-Stool "Baby" No. 1,	325 "	100.—
"Alpha" Iron-Stool "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 2,	450 "	125.—
"Alpha" High-Frame "Baby" No. 3,	850 "	200.—
"Alpha" Dairy Steam-Turbine,	850 "	225.—

Great as has been the previous superiority of the "Alpha" De Laval machines to other separators the 20th CENTURY "Alpha" developments place them above the possibilities of attempted competition from anything else in the shape of a cream separator.

THE DE LAVAL SEPARATOR CO.,

GENERAL OFFICES:

CHICAGO. 74 Cortlandt Street, MONTREAL.
SAN FRANCISCO. NEW YORK. PHILADELPHIA.

Wanted—At once, an experienced single man who understands the feeding and care of dairy cattle, to take charge of our fine herd of Jerseys. Please write, stating wages wanted and give references. Address P. O. BOX 124, Liberty, Ind.

Correspondence solicted with parties having capital to invest in private creamery. 230 cows pledged within radius of four miles; more to come as soon as creamery starts. Splendid dairy country. Five miles to R. R. station. Address, J. M. MOE, Chetek, Wis. 50-3

Wanted—By March 15th or 20th, to work on farm by season or year, an ablebodied, sober, all round good farm hand. Good home to right party. Must be a good milker. FRANK CRUMLETT, Box 276, Sleepy Eye, Minn.

The undersigned wishes to arrange for a regular shipment of four cans of high grade milk with some dairyman near Milwaukee. Address, P. J GROGAN, 2611 Sycamore St., Milwaukee, Wis. 50-3

For Sale—Jersey bull 6 yrs. old, sired by Matilda 4th's Son, sire of 13. Dam, Ida's Alpha, test 25 lbs. 15¾ ozs. Sure breeder and gentle. Price low. FRANK X. HOFFMAN, Millersville, Sandusky Co., Ohio.

For Sale—Twenty-five high grade Jersey cows, thirty-five one and two-year-old heifers, by St. Helier's Cowboy 44822. For particulars address, HUMPHREY BROS, Fairmont, Kansas. 50-4

Wanted—A position as manager of creamery or cheese and butter combined, in some good dairy country. Student of the Danish and Swedish Dairy Schools; also with years of experience in the latest improved modes of making butter and cheese. The best references can be furnished. Address, CANTON CREAMERY, Canton, So. Dakota. Box 337.

Wanted—Farm manager. A man capable of managing a farm of over five hundred acres, with dairy of 200 registered Jersey cows. Must thoroughly understand care of stock and handling of labor. None but competent, energetic man, able to give best of references, need apply. Address, B. E. W., P. O. Box 520, Philadelphia, Pa.

Cheesemaker wanted to operate a small first-class plant. Address No. 6, care Hoard's Dairyman. 49-2

For Sale—De Kol Bulls. Officially tested dams. Send for catalogue. M. S. CAMPBELL, Genoa, Ill. 49-10

For Sale—Pure bred Tamworth pigs ready to wean. Also a few Holstein bull calves. GLIEDT & KAISER. Freistatt, Mo. 48-6

Wanted—To rent, a creamery in a good locality with a good run of milk. Prefer one fully equipped. Address LOCK BOX 45, Lake Mills, Wis. 48-4

Wanted—Experienced man to help care for our herd of selected Holsteins. Must be first-class milker, reliable, temperate and intelligent. Address, with references and wages wanted by the year. DELLHURST FARMS, Mentor, Ohio 48-3

For Sale—One large Turbine De Laval separator and two twin cream vats, capacity 200 gals. each. Are in good condition. Address, LANCASTER CREAMERY CO., Lancaster, Pa. 48-4

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman. 44-tf

Wanted—A first-class cheese maker wants a factory to manage. Ten years experience. Nine years in one factory. Correspondence Solicited. G. S. COLE, Tallapoosa, Georgia.

Wanted Now—A strong, able and sober married or single man to work by the year on farm in Illinois. Must be good milker. For further particulars address A. J. DAUGHERITY, Streator, Ill. 46-tf

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

To Let—Sub-divisions of Prairie Farm, 160, 200, 300 and 400 acres, 16 miles from Toledo Separator Creamery. Silos and special butter customers. These are first-class farms, stocked with first-class cows, and none but first-class dairymen need apply. State experience and resources in application. Address, E. L. LOCKWOOD, Petersburg, Mich. 47-tf

For Sale—Dairy and outfit. Terms easy. R. A. LAMBERT & SON, Mobile, Ala. 46-tf

Buttermaker of 9 years' experience wants a steady position. Married. Will furnish good references. Work guaranteed. State wages. Address J. R., care HOARD'S DAIRYMAN. 46-tf

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis.

McHenry County Farmers' Institute, Harvard, Ill., Jan. 31-Feb. 2.—The C. & N. W. R'y will sell round trip tickets from Fort Atkinson for above occasion for $1.95.

Grand Excursion to Old Mexico—Via Chicago & North-Western Railway, to leave Chicago Tuesday, January 30, 1900, under personal direction of Mr. J. Grafton, an experienced excursion manager. Entire trip in special train with dining car. Tour is arranged to include Mardi Gras at New Orleans and all principal points of interest in old Mexico and ticket covers all expenses. Only limited number can be accommodated; secure space early. For descriptive pamphlets and information, call on, or write agents Chicago & North-Western R'y. 47-4

Tour of Puerto Rico.—The American Tourist Association announces two tours of the beautiful island of Puerto Rico under escort of Mr. Walter Boyd Townsend, the well-known artist and traveler, through and around the Island by rail, carriage, automobile and boat. Special Pullman Cars leave Chicago Thursday, February 15, and Thursday, March 8, at 12, noon, connecting with the splendid new steamships Ponce and San Juan sailing from New York second day following. Tickets include all expenses everywhere. All railway, steamer and sleeping-car fares, meals and berths on steamers, meals on dining car, hotel bills in New York and Puerto Rico, all transfers, carriage rides in the cities and through the Island, guides and interpreters are included in the tickets. There are no extras. Tours are under the direction of Reau Campbell, General Manager, A. T. A., 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to the Agents of the Chicago, Milwaukee & St. Paul R'y. 48-sp

Making Cheese on the Farm.

Can you send me your printed formula for making cheese? I desire to make small cheese 5 lbs. just for my family use.

Martin Co., Minn. Mrs. THERON FISK.

We have no special printed formula for making small cheese. The methods of making cheese are as different as the varieties. Perhaps for home cheese making, the following will be found acceptable. The quantity of milk used and curd produced may be larger than is wished, but they can be easily reduced for a smaller cheese.

1. With a milk can: Set the can of milk into a wash tub, and pour water, previously warmed, into the tub to warm the milk to the proper temperature for adding the rennet. When the curd has been cut the whey can be heated to the scalding temperature in like-manner.

2. With a tub: The milk is put into the tub, then part of it is heated in a kettle to 115° F. and returned to the tub so that the temperature is raised to 86° F., ready to curdle. After the curd has been cut, and the whey well separated, dip out some of the whey into the kettle, and heat it up to such a point that when returned to the tub the whole of the whey will be 93° F. After stirring for a few minutes a second lot of whey can be dipped out and heated to such a point that when returned to the tub the whole will be 98° to 100° F. The details of setting the milk with rennet, drawing the whey, etc., will be given later.

For regular business a small vat will be necessary. Such a vat is made of tin, rectangular in shape, and sets into a water box of similar shape. The water in the box can be heated by steam if a feed cooker is handy, or by means of a flue in the bottom. Such vats are made by dairy supply houses, or can be gotten up to suit, at a local tin shop.

To get the whey off, a cylinder made of perforated tin is set into the vat, and a siphon inserted in it. The perforated cylinder prevents the curd from getting out.

One will need a correct thermometer and a glass graduate, both of which can be purchased at the drug store. A curd knife of six or eight blades will be needed to cut the curd. The curd can be broken with a wire harp made for the purpose, but it will not be as good as a knife.

Now that we have the apparatus, we can proceed to make the cheese. We do not want the milk so very sweet, as it is just after milking—neither do we want it sour. The lactic acid germs evidently give flavor to cheese, and we want to give them just a little start without the milk being sour. If one quart of sour milk (not quite thick, but decidedly sour to the taste) should be added to sweet morning's milk, it would make it about right. If the night's milk has been kept at a temperature of about 60° to 65° F. and added to the morning's milk, it will probably be about right without the quart of sour milk.

The milk is heated to 86°—90° F. and is then ready for the rennet. If any artificial color is desired, commercial color can be added to suit, at the rate of one-fourth ounce to one ounce per 1,000 pounds of milk.

Do not attempt to prepare your own rennet. Rennet extract can be had, or what is perhaps better still for farm dairy purposes, are rennet tablets. They can be procured of Chr. Hansen's Laboratory, Little Falls, New York, or of any of the dairy supply houses. Use about three ounces of rennet per 1,000 lbs. of milk, or if tablets, one tablet to 100 lbs. of milk. The tablets should be dissolved in water fifteen to twenty minutes before using.

The rennet extract should be diluted in a pint of warm water before adding it to the milk. It should be thoroughly stirred in. In twenty minutes the milk should be coagulated, so that when the index finger is inserted, the curd will break clean over it. This should be the test for the curd when ready to cut. If it reaches this condition in twelve minutes, cut it, if not till thirty minutes, wait till then.

Now insert the knife, cutting lengthwise first, and then crosswise till the curd is cut evenly into cubes one-half inch, or a little less in diameter. Then stir gently, and raise the temperature in half an hour to 98° F. The curd should then get firm—should in an hour and a half get so that it will "queak" between the teeth, and when pressed together in the hands, fall apart readily when the pressure is removed. This is what is termed a "good scald," or a "good cook." It really means that the whey is expelled properly. If necessary, the temperature can be raised several degrees to accomplish this end, but it is better if it is not necessary.

There is danger right here that we must avoid, and that is that the acid may develop and give us a sour cheese. A very little acid will do no harm (in fact the cheese will be better for it), but too much will spoil it.

One should watch for the development of acid with a hot iron. This iron can be a half inch iron rod or gas pipe. One will have to learn by experience just how hot to heat it, but we can say that it must not be so hot that it will burn the curd. When fine strings stick to the iron—when the curd is pressed against it and drawn away—one-eighth of an inch long, the whey should be gotten off from the curd, for much more will make a sour cheese. When the whey is well drained from the curd, the longer strings will do no harm, but do not let them get longer than that while in the whey. It might be well to wait a little while for the strings to show on the hot iron, but if they do not appear in three hours from the time the milk is set, and we have a firm curd, draw the whey anyway. Draw the whey off with the siphon, as has been mentioned. The vat should be tipped a little, to let the whey run down to the lower end. The curd should be heaped up in the upper end of the vat, with a channel through the middle of the heap, for the whey to drain out. The curd should be stirred occasionally to loosen it up and let the whey out.

As soon as thoroughly drained we can salt. Use two and a half pounds of salt per hundred pounds of curd. This will be one pound of salt to forty pounds of curd, and it should be thoroughly stirred in. In about twenty minutes it will have worked into the curd, which will be ready to press.

Anyone with a little ingenuity can fix up a hoop and a lever press.

A hoop to press a forty-pound cheese should be 14½ inches in diameter and eight inches deep. Bandage can be made out of cheese cloth to fit, or can be bought. A much handier hoop, than one can make, can be bought for $2½ of the supply house.

We would advise putting a bandage on the sides and caps on the top of the cheese. If one does not wish to bother with the ready made bandages, a wooden hoop can be made (wood will make the cheese close better than metal) and a bandage two or three inches wide can be wound around the cheese. Muslin caps that are used in the hoop, on the end, should be left sticking to the cheese. This will prevent the cheese cracking.

It should be pressed about 24 hours, and then go into the curing room. It should be set on a clean wooden shelf and turned and rubbed every day. The temperature of the room should be 60 to 65° F., A higher temperature for any length of time will develop bad flavors.

The cheese will be cured enough in a month to suit some tastes, but it is not really cheese at that time.

Pennsylvania State Grangers.

ED. HOARD'S DAIRYMAN:—No one who attended the twenty-seventh annual meeting of the Pennsylvania State Grange, in session last week from Monday to Friday at Lock Haven, could help but see that farmers, as well as others, were enjoying a greater era of prosperity now than they have for several years. This fact was noticeable not only in the appearance of the crowd but in the general satisfied air of all and the largely increased attendance. Much of the business transacted was of unusual interest, not only to the vast body of Grangers, but to all agriculturists in this state and elsewhere. The roll call at the opening session of the fourth degree disclosed the fullest attendance in years. W. F. Hill, of Crawford county, Master of the State Grange, presided. In his annual address he dwelt at some length on many questions of momentous interest to the Grange, and made numerous important recommendations having for their object the betterment of prevailing conditions of the farmer. Among other things Master Hill said that the agricultural people had cause for congratulation over the social, educational and financial benefits derived through the efforts of the organization. The problem of trusts must be intelligently and effectively treated. Regret was expressed that Governor Stone felt it incumbent to cut the school appropriation one million dollars, inasmuch as the $11,000,000 formerly appropriated was obtained through the demands of the Grange for a law equalizing taxes. The present discrimination of postal facilities in favor of the cities was deprecated, while the efforts of the postoffice department for the establishment of free rural delivery was heartily commended. In speaking of roads Master Hill said that the time was not far off when a demand would be made for an intelligent plan of township road construction and maintenance. In closing the Master recommended a change in the representation from the subordinate Granges on the basis of numerical membership.

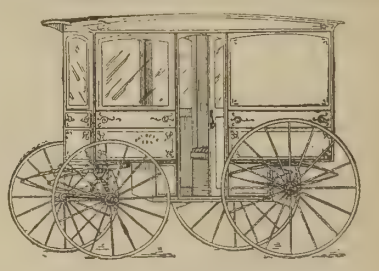
The report of Secretary J. T. Ailman showed that during the year six new Granges were organized, seven new Granges with a membership of 290, were instituted, 1,415 members were initiated and and 463 reinstated. Overseer E. J. Tuttle, in his report, recommended a more equitable oleomargarine bill, the removal of renovated butter from competition with honest dairy products, and condemned the Senate for defeating the reform tax bill passed by the House at the last session of the legislature. Hon. Mortimer Whitehead, of New Jersey, spoke to the meeting

The Singer No. 24.

AUTOMATIC CHAIN-STITCH.

THE SINGER MANFG.CO. TRADE MARK

The general advantages of this type of machine for family sewing comprise greatest ease and quietness of operation, simplicity of construction and the elasticity of the single thread seam. When needle is threaded the machine is ready, the stitch requiring neither bobbin nor shuttle. The thread is taken from one spool and is so interwoven and twisted that seam cannot rip unless its finished end be unlocked. When this is done, the entire length of thread can be quickly withdrawn without injury to the fabric.



Every genuine machine carries the trade-mark.

Sold on Instalments. You can try one Free. Old machines taken in exchange.

SINGER SEWING-MACHINES ARE MADE AND SOLD ONLY BY

THE SINGER MANUFACTURING CO.

OFFICES IN EVERY CITY IN THE WORLD.

GRINDSTONE

COMPLETE WITH FRAME

$1.90 EACH.

Upon receipt of $1.90 we will forward, properly packed, one celebrated BUENA VISTA GRINDSTONE and FRAME Complete, which we warrant to be Absolutely Unexcelled as to quality, finish and durability. This celebrated stone is the highest quality on the market and will be found excellent for any grade of work. We use nothing but first grade stones. They weigh from 40 to 50 pounds. In order to save on the freight charge, we will ship knocked down. It is simply constructed and can be readily put together.

We carry all kinds of grind stones. Write for free catalogue No. 20 on merchandise bought at Sheriffs' and Receivers' Sales. *OUR PRICES ARE ONE-HALF OF OTHERS.*

The Fear of Humbug

Prevents Many People From Trying a Good Medicine.

Stomach troubles are so common and in most cases so obstinate to cure that people are apt to look with suspicion on any remedy claiming to be a radical, permanent cure for dyspepsia and indigestion. Many such pride themselves on their acuteness in never being humbugged, especially in medicines.

This fear of being humbugged can be carried too far, so far, in fact, that many people suffer for years with weak digestion rather than risk a little time and money in faithfully testing the claims made of a preparation so reliable and universally used as Stuart's Dyspepsia Tablets.

Now Stuart's Dyspepsia Tablets are vastly different in one important respect from ordinary proprietary medicines for the reason that they are not a secret patent medicine, no secret is made of their ingredients, but analysis shows them to contain the natural digestive ferments. pure aseptic pepsin, the digestive acids, Golden Seal, bismuth, hydrastis and nux. They are not cathartic, neither do they act powerfully on any organ, but they cure indigestion on the common sense plan of digesting the food eaten thoroughly before it has time to ferment, sour and cause the mischief. This is the only secret of their success.

Cathartic pills never have and never can cure indigestion and stomach troubles because they act entirely on the bowels, whereas the whole trouble is really in the stomach.

Stuart's Dysyepsia Tablets taken after meals digest the food. That is all there is to it. Food not digested or half digested is poison as it creates gas, acidity, headaches, palpitation of the heart, loss of flesh and appetite and many other troubles which are often called by some other name.

They are sold by druggists everywhere at 50 cents per package. Address F. A. Stuart Co., Marshall, Mich., for little book on stomach diseases, sent free.

B. C. SCOTT,

211 Beach Street,

Bridgeport, Conn.

on a number of important topics, among which were the advocacy of putting a tax on corporations and trusts, for the making of good roads, and his opposition to free products from Cuba and Porto Rico, and to a standing army for America.

The committee on legislation, through W. T. Creasy, submitted an unusually interesting report. Many facts in connection with the defeat of the tax bill at the last session of the legislature were given. The report also shows up the present system of taxation in a bad light, and states that "the taxations of corporations lies practically in the power of one man in the auditor general's department, a system that meets with the condemnation of all who are intimately acquainted with its working." The report included the following: "We believe the time has come for the farmers, and other real estate owners of the state to assert their rights and formulate a tax bill similar to the laws in operation in other states, so that the burdens of government shall be justly distributed among all protected thereby."

The committee on National legislation favorably reported a resolution asking Congress to regulate trusts. It says: "Congress should enact such legislation as shall compel such combinations to occupy their own position as creatures and servants of the public by enforcing publicity of their methods and accounts, preventing over capitalization in its various forms and forbidding discrimination in charges."

Among other resolutions was one urging for the enactment of a law regulating interstate traffic in foods, drugs and condiments, and one asking for the extension of the free rural delivery as rapidly as possible, and that the same, when established, be placed on the same permanent footing as the delivery of mail in cities and towns. The committee on roads recommended the legislative committee of the State Grange to draft a road law and present and urge the passage of the same at the next session of the legislature; on education the committee recommended the repeal of the school term law and the establishment of township high schools and payment of better wages to teachers. Other reports were making game the property of the owner on whose land it is found and that U. S. Senators should be elected by direct vote of the people. C. L. GATES.

Bellefonte, Pa.

The Hairy Vetch.

ED. HOARD'S DAIRYMAN:—I highly prize the DAIRYMAN and find it both interesting and instructive.

I am especially interested in forage crops, especially those which improve the soil while they feed the stock. For years past I have been in search of some crop which would remain green after the frost in the fall has bitten the fodder. My attention was called by your valuable paper, to the "Hairy Vetch"; the article was written by the professor of some dairy experiment station and school, (don't remember date or page) and I think I shall try sowing some next spring, with oats for soiling, as was done in the experiment.

Any more information that you can give on this subject will be carefully watched for and highly appreciated. B. B. T.

Broodman, Va.

The article referred to will be found on page 414 of the current volume of the DAIRYMAN. It was an extract from a bulletin issued by the Michigan Experiment Station. The true value of the hairy vetch has not yet been positively determined, and we should be glad if those of our readers who have tried the plant would give us their experience.

A CONVINCING LETTER.

The editors of HOARD'S DAIRYMAN may be pardoned once in a while if they exhibit, as a good farmer does his fine cattle, some proof of the fact that the paper has done good work in its line.

The following letter from Mr. J. E. Putnam, an extensive milk dairyman, near Fitchburg, Mass., is a case in point:

ED. HOARD'S DAIRYMAN:—Thinking a word of praise with a "Merry Christmas" would not come amiss, I write you of the benefit derived from your valuable paper.

I have been in the business twenty-two years selling from five to six thousand dollars worth of milk each year at retail in our city, but in the past three years I have learned more through your paper than in all the previous years. Your illustrations of the "dairy form" are invaluable to the man who seeks to know his business, and follows them. They are worth millions of dollars to your readers in their business of dairying throughout this country.

I enclose subscription for myself and my friend. Wishing you a Happy New Year, I am very truly yours, J. E. PUTNAM.

We beg to tender Mr. Putnam our sincere thanks for his kindly and encouraging letter. Coming as it does from a man who is largely and successfully engaged in dairying, it proves all the more valuable, as a lesson to us and the vast multitude of cow keepers in this country, who *do not yet think* they can learn anything to their advantage from a good dairy paper.

Cheese Questions.

What kind of cheese is best adapted to a farm dairy of from 20 to 40 cows?

What book or books give best instruction about cheese making?

Is cheese making, in your opinion, as easily learned as butter making?

Is cheese making as profitable as butter making for a dairy, say, of thirty cows? If not, why? E. F. D.

Albion, Pa.

It is not possible to decide definitely without knowing the local conditions, but it is probable that a small cheese like Neufchatel or Gouda would be most suitable.

"A B C of Cheese Making," by Monrad, price, $0.50. "Decker's Cheddar Cheese Making," price $1.00.

From the varying conditions of milk and produce, cheese making is by far the most difficult to learn.

If you are making a special cheese at a special price, then cheese making is the most profitable; but with Cheddar cheese making, the question of profit depends on the price of butter.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy and Live Stock Meetings—Milking Competitions—Eastern Ontario Dairymen's Meeting.

ED. HOARD'S DAIRYMAN:—In connection with the Ontario winter show, there is held each year the most important milking competition that takes place in Canada. The last show was held at London, Ont., during the third week of December, and was in several respects, a notable one. It is called the Provincial Fat Stock Dairy and Poultry Show, and its prize list is largely subsidized by the local government through the Breeders' Association.

In addition to the exhibits of pure bred cattle, sheep and swine, there were competitions in dressed hogs and sheep. In the swine section the killing contest was for the purpose of demonstrating the best type of hog for bacon purposes. About sixty hogs entered this contest, representing all the leading breeds of swine in this country. The carcasses were judged by experts from the packing houses and formed a most valuable object lesson for those present. They were afterwards shipped to one of our leading packing houses and further reported upon.

In this competition the improved Yorkshires came out on top. While this was so there were several other breeds such as the Berkshires and Tamworths, which showed some desirable qualities as bacon hogs. The latter, though as a breed generally well adapted for bacon purposes, were, according to the packers' report, unfinished and tender. There was in the whole lot of carcasses a large proportion of soft sides, which are unsuitable for making bacon of the finest quality. The cause of this was claimed by experts to have been largely due to the practice followed by many exhibitors of sending immature and unfinished hogs, which, when cut up, showed this soft quality in the fat.

But it is the dairy contest in which the bulk of your readers will be most interested. This was a notable contest for one important reason. The world's record, so it is claimed, for a butter-producing cow was broken, and the standard raised a notch or two higher and that by a cow that entered the public arena for the first time.

In the test every side issue was discarded and the awards were based solely on the butter fat and other solids in the milk, a few points only being given for period of lactation. The following is the scale of points: 20 points for each pound of fat, 4 points for each pound of solids, not fat, and 1 point for each ten days in milk after the first 30 days, up to ten points. No cow was awarded a prize which was not producing at the rate of 10 pounds of butter per week.

A year ago when the show was held at Brantford, a Holstein cow, Calamity Jane, owned by A. and G. Rice, Curries, Ont., made the big record of 21½ pounds of butter per week by the Chicago World's Fair standard of 80 per cent butter fat. But it remained for this record to be beaten by another Holstein cow at this winter's show. This cow, Aaltje Posch 4th, is owned by Rettie Bros., Norwich, Ont., and made the almost phenomenal record of nearly 4½ pounds of butter per day, or 29.6 pounds per week according to the World's Fair standard. This record, figured at the Canadian standard of 85 per cent butter fat, would be nearly 28 pounds of butter a week, which seems to leave all other records in the shade.

She was milked three times a day—5:30 a. m., 1:30 p. m., and 9:30 p. m. The first two milkings weighed 49 lbs. 6 ozs., and tested 4 5 per cent fat; the next three milkings, 74 lbs. 2 ozs., testing 4.8 per cent fat and the last milking 23 lbs. 6 ozs., testing 4.3 per cent fat, making a total of 6.785 lbs. of butter fat in 48 hours. The average cow on the ordinary farm is said to produce not more than 4 lbs. of butter a week and here we have a cow that is as good as seven ordinary cows. What a lesson there is in this for the average dairyman who thinks one cow as good as another.

The remarkable thing in this test is the high per cent of fat in so large a quantity of milk given by one cow. The Holstein is not noted for giving a large per cent of fat, but this and other tests show that she is improving in this regard. This cow was a few days over one month in milk, and as we have stated this was her first appearance in a test of this kind. The falling off in the per cent of fat in the last milking is claimed by the judges to have been due to the large number of visitors, who thronged to see this cow as soon as it became known that she was breaking the record.

In the other classes some very good cows were shown. Only one Jersey competed which is somewhat surprising, as there was a separate section for each breed, the best of each competing for the sweepstakes. This Jersey, however, did very well considering the care she had, and gave at the rate of 16½ lbs. of butter per week, her highest test being 7% of butter fat. Shorthorns were well represented. Rene, owned by A. W. Smith, Maple Lodge, Ont., making a record of 81 lbs. of milk with 3 lbs. fat equal to 12½ lbs. of butter per week. The first prize Ayrshire was owned by N. Dyment, Clappison, Ont., and made a record of 81 lbs. milk, 3.4 lbs. of fat in the 48 hours, eqnal to 14 lbs. of butter per week.

This test was one of the most exhaustive that has taken place in Canada and gave as full information as to the value of the different cows for butter purposes as was possible, unless the food consumed was taken into account. We think an effort should be made another year to have the cost of the food consumed taken into account. With this factor known, we would be able to estimate more accurately which is the most profitable cow for the farmer.

The test was conducted by Prof. Dean, of the Ontario Agricultural College, and Mr. James Stonehouse, of the Provincial Dairy School. Below will be found a tabulated statement of the results of the test which may be found interesting:

NAME OF COW AND OWNER'S NAME AND ADDRESS.	Total lbs. of milk in 48 hours.	Lbs. fat.	Lbs. solids not fat.
CLASS 50, SEC. 1—SHORTHORNS, 36 MONTHS AND OVER.

Write for what you want. Visitors always welcome. **JOHN E. ROBBINS, Greensburg, Ind.**

12. The officers of this Association, with an evident desire to carry the gospel of good dairying to the newer sections of the country, held their meeting this year at Madoc, one of the sections of the province that is coming to the front in dairy matters.

Their decision in this matter was proven to be wise and good. There was a splendid attendance, the opera house, where the sessions were held, being taxed to the uttermost, to accommodate the people. This was gratifying both to the officers of the Association and the speakers. The speakers who attend our dairy conventions, always come prepared to say something worth while listening to, and it must have been very gratifying to them to have such fine attentive audiences to unload their wares upon.

The gathering was presided over in his inimitable way by the inimitable (Dan) Derbyshire. There may be chairmen who can keep an audience in as good humor and in as good a listening attitude as the peerless Daniel, but we would like to know where they are. The dairymen of Eastern Ontario recognize this among his other good qualities and every year elect him their chief officer, and well he fills the bill.

The president's annual address this year contained among others one point of special mention. He strongly emphasized the importance of cheaper production in order that dairymen may make the most of their business. Some times this important factor is forgotten in the discussion of quality and methods of manufacture. But the dairyman must get his business down to a good paying basis, if he wishes to succeed. Then good quality and cheaper production go hand in hand. It never pays to produce an inferior article under any circumstances.

Prof. Grisdale, of the Central Experimental Farm, Ottawa, discussed the development of the dairy herd. He described the ideal dairy cow as one with a long deep barrel, showing large stomach capacity with a large mouth to take in food, large milk veins and a big udder. He urged the selection of food to meet the requirements of this type of animal. Plenty of nitrogenous food such as oil meals should be given with her ensilage and roots. Only the best pure-bred sires should be used and the dam of both sire and dam should have been good milkers. Cull pure-breds were worse than good grades.

Pasteurizing received some attention, the subject being introduced by Supt. Hart, of the Kingston Dairy School. He strongly advocated this practice and the use of pure cultures in butter making. This would improve the quality of the butter and was largely practiced in Denmark and the United States. Pasteurizing has been most successfully carried on at the Kingston Dairy School and was easy to accomplish in any well regulated creamery.

A very practical talk on cheese making was given by G. G. Publow, of the Kingston School. He emphasized the importance of good food for cows giving milk and cleanly surroundings both at the farm and factory. Important points in the process were the time of setting, the quality and quantity of rennet used and the salting of the curd. Makers were often astray in thinking that the acidity came from the whey around the curd and that the draining of the whey removed the acid. The acid came chiefly from the whey in the curd. He would use a starter only to get rid of taint or bad flavor. He advised deep piling for best flavor, although the contrary plan, perhaps, gave a greater quantity of cheese. Makers were warned against curing cheese at too high temperatures. Careful and frequent turning of the cheese was necessary to prevent bitter flavors developing.

Mr. J. W. Newman discussed the methods of securing proper conditions in the curing room. He emphasized proper insulation, lessening radiation and makers having a knowledge of and keeping record of these particular conditions.

Along this line Dr. Connell, Kingston, Ont., read a paper on the Bacterial Content of Cheese in Regulated and Unregulated Curing Rooms. The greatest bacterial content is normally found in cheese when from one to four days old. Following that period there is a continuous decline in the number of bacteria. Lactic acid bacteria are practically the only bacteria found in normally cured cheese. Cheese in the ordinary or variable curing room would more commonly go off flavor and quicker, than in the well regulated curing room. Though, not definitely located, it seems certain that the curing agent is either in the milk or is formed during the process of manufacture and in the few days immediately following the placing of the cheese in the curing room.

Other speakers who gave valuable and instructive addresses were C. C. James, Deputy Minister of Agriculture, Toronto; Prof. Dean, Ontario Agricultural College, and F. W. Hodson, Dominion Live Stock Commissioner, Ottawa.

The convention closed with the election of officers, when the old board of directors were unanimously re-elected for 1900. The Secretary of the Association is R. G. Murphy, Elgin, Ont. Several instructors are employed during the summer months in visiting the factories, and the Association spends its annual grant wisely and well.

Toronto. J. W. WHEATON.

Eight Cows Make 60 Lbs. Butter Per Week. Ration Cannot Be Improved.

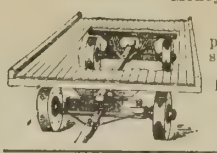
ED. HOARD'S DAIRYMAN:—Will you please give an economical, balanced ration from the following. Cows are Jerseys weighing from 700 to 900 pounds:

Corn stover, (do not know price); clover hay, $8; oat straw, $3; corn, 40 cents per bushel; oats, 32 cents per bushel; bran, $16 per ton; middlings, $18; oil meal, $30 per ton; cotton seed meal and gluten not on the market. Am feeding now, 13 lbs. corn stover, some clover hay and oat straw for them to eat at leisure, 4 lbs. corn and cob meal mixed with equal parts oats, 6 lbs. bran, and a little oil meal. Think it too high to feed much.

I am a renter, began last spring; am milking eight cows; make butter; have private customers; make about 60 lbs. per week at present. Weigh and test all milk; have a Baby separator, all the result of reading HOARD'S DAIRYMAN. Would like to give you my report, if you so desire, when my year is up; have several cows which have passed the 300 lbs. mark, and three months to go on yet, and are fresh at present. Have no silo, but wet stover with hot water one feed ahead. Think I have saved many dollars in the selection of my cows, by reading the DAIRYMAN."

Columbiana, Ohio. I. B. WITMER.

We print the above letter in full, to show what results may follow a close and appreciative study of HOARD'S DAIRYMAN, especially where a man has not too firmly grounded opinions, which have been handed down to him from former generations, or acquired under conditions which do not obtain at the present day. A man selects cows upon principles which have been advocated and illustrated in this paper; he feeds these cows and cares for them in ways suggested in these columns, with the result that he is now getting 60 lbs. of butter per week from eight cows, and that several of these cows, although only nine months in milk, have already passed the 300 lb. mark.



Such a record as this would seem to forbid any advice for changing the methods already pursued. We hardly like to admit of course, that any degree of success is good enough, because we have been brought up on the theory that there is always room for progress and betterment. We have to confess, however, in the present instance, that we do not see wherein the manner of feeding these cows can be improved. While it is true that oil meal is very high, yet we apprehend that a moderate allowance of this feed, under the circumstances, will prove very profitable.

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill, a catalogue giving full description may be obtained. They are made in all sizes.

A "Handy" will save The wages of a hired man. Your back from being strained. Your field from being cut up. Money and labor every day.

Send us your name on a postal card and we will send information free.

FRED TSCHUDY & SON, Monroe, Wis

New York State Dairymen's Annual Meeting.

ED. HOARD'S DAIRYMAN;—The twenty-third annual meeting of the association was held in Cortland, Dec. 13, 14 and 15. Mr. W. Brown Richardson, of Lowville, a very efficient resident, presiding; the other elective officers were also present, as well as delegations from more than forty counties of the state. Visitors were also present from New Jersey, Pennsylvania, Ohio, Michigan, Wisconsin, Illinois and other states; while the audiences during the sessions of Thursday and Friday (six in number) varied from 500 to 800.

There was no formal meeting on Wednesday, and it was not till Thursday morning that the first session was called by Mr. Geo. A. Smith, who introduced Judge J. E. Eggleston, of Cortland, who made a somewhat lengthy address of welcome, to which Mr. George E. Royce, of Gouverneur, responded in one nearly as long. Following, came the President's address, which was spoken, not read. Ex-President, J. S. Shattuck, of Chenango county, followed the President, in an address, in which he related some bits of interesting dairy history, connected with the old association and Chenango county. It concluded the first session.

In the afternoon, there were a half dozen questions read from the box, which were answered briefly by Prof. Jordan, H. E. Cook, Edward Van Alstyne and others, all of whom were institute speakers; but none of the questions, or the answers, brought anything really new, therefore, they are not reported here.

The short discussions closed. Prof. H. H. Wing, of Cornell, gave an interesting talk, the text of which was: "Condition of Cheese and Butter Factories of New York." As a rule, the conditions are neither better nor worse than in other dairy states; but the Professor spoke earnestly on the conditions of milk cans, factory vats, clothing and dairy utensils.

In this connection, he said in part and in substance: In 1898, there were some 148 factory reports received; of this number, 20 factories had been visited, twice or more. As a rule, they were found in better condition at the second visitation. There were included in the whole number, 74 cheese factories and 45 butter factories, also 5 private dairies, and 4 milk shipping stations. In nearly every report, there was a complaint that one or more sanitary rules were being violated by patrons or makers, or both. As a rule, in the factories visited, churns, butter workers and vats were found in good condition, but there were evidences of neglect seen elsewhere. In some factories tobacco was being used, a practice which should be discontinued.

In fifty-five of the places visited, the floors were littered with cold cooked potatoes, dirty utensils, clothes, and other things, which ought not to have been there. Factory smells were distinguishable in 71 places, but absent in 73; and, in some factories the effect of bad drainage was plainly the cause.

In speaking of the temperature of curing rooms, he said that, in almost every place visited, it was found to be the same out of doors as in the curing rooms.

The senior editor of the DAIRYMAN was the next speaker, his theme being, "Conformation of the Dairy Cow," which he illustrated by the use of his large colored drawings, in which are represented the types of some of the dairy, as well as the beef breeds, of cattle. The address concluded the forenoon hour.

AFTERNOON.

There were four questions found in the box, which the President read, and which were answered by Prof. Jordan and Messrs. Cook and Smith. The one of most importance, and to which most time was devoted in answer, being, "How can an Old-fashioned Barn be Ventilated?" Mr. Cook answered it at some length, in which he told how Prof. King, of the Wisconsin Experiment Station, has ventilated the barns there, and how he, Cook, proposes to ventilate a barn which he will build next summer.

It is quite difficult to ventilate the real old-fashioned barn, but it may, as a rule, be done by running shafts up the stable walls, thence along rafters to the peak, where they open into ventilators, passing through the roof.

Mrs. Anna Barrows, Editor of *American Kitchen*, Boston, Mass, when Mr. Cook had concluded his answer to the question on ventilation, made the evening address, her topic being "Dairy Products as Substitutes for Meat."

Friday morning's session opened at 10:30, when three questions—oral—were answered by Prof. Jordan and Prof. Wing, after which Mr. Franklin Dye, Secretary of the New Jersey Tuberculosis Commission, made quite a lengthy address, his subject being "Tuberculosis Legislation Control," in his state. Mr. Jared Van Wagenen, Jr., of Lawyersville, Otsego Co., was the next speaker, who discoursed upon the "Model Creamery Butter Maker." He was followed by Mr. George A Smith, who is the dairy expert at the Geneva Station, in a valuable paper, the head of which was, 'Problems in Cheese Making." It concluded the morning's program.

The afternoon session was opened by the Hon. D P. Witter, of Tioga county, who is chairman of the Tuberculosis Investigating Committee in this state. He gave an entertaining resume of the work done by his committee, at their various sittings in the state last season. He said that they found the disease less frequent in this state than it is reported to be in some others; also that they found other cattle diseases of more prominence, and deserving of more attention than is tuberculosis.

He also said that it was his purpose during the coming winter to introduce a bill bearing on the case, which will improve, if it goes on the statute books, the others now in force. His address concluded, the president called for the reports of the various committees, which were handed in, read, submitted and adopted.

Prof. E. B Vorhees, director of the New Jersey Experiment Station, was next introduced and discoursed on "Progressive Dairy Farming." He was followed by Major Henry E. Alvord, of the Agricultural Department, Washington, D.C., who made a congratulatory address to the Association; after which Mr. George Flanders, of the department of Agriculture, Albany, devoted a half hour or more to discussing the oleo situation in this state, in which he made the statement that but little, if any, oleo was now being sold in this state. Mr. Flanders' address concluded the session.

The last session was opened at 7 p m. and was consumed by Ex-Gov. Hoard in an address devoted to better dairy education and practice all along the line, which held the large audience in their seats till nearly 10 o'clock.

Following are the names of the officers elected for the ensuing year:

President, George A. Smith, Frankfort; vice president, Professor H. H. Wing, Ithaca; treasurer, F. E. Dawley, Fayetteville; secretary, W. W. Hall, Gouverneur; honorary vice-presidents, Theodore Roosevelt, Timothy Woodruff, C. A. Wieting, W. Cary Sanger, George H. Hyde, Charles H. Royce, Frederick H. Merry, W. E. Dana, J. P. Clark, R. H. Bent, E. J. Preston, C. M. Lamont, F. A. Converse, E. A. Van Alstyne, A. D. Harrington and V. C. Beebe. The next annual meeting will be held in Watertown, opening the second Wednesday in December.

The sessions at Cortland were held in the Opera House but the exhibits of butter, cheese, dairy machinery and other supplies were several blocks distant in a large show room of the Cortland Wagon Company. It was a hall, 40 by 200 feet, plenty large enough for the purpose, for the reason that it was visited by but a comparatively small

Two Wagons at One Price.

It is a matter of great convienience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel Wheels, with either direct or stagger spokes, with broad faced tire, are made to fit any axle. You can convert your old wagon to a low, handy wagon in a few moments time. You thus virtually have two wagons at one price. Write to the Electric Wheel Co., Box 130 Quincy, Illinois, for their catalogue, which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers, etc.

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

HIGHEST STANDARD.

Alderney Butter Color.

There is never a time when it fails to satisfy even the most critical, because it always maintains its **HIGH STANDARD** of **PURITY, STRENGTH** and **UNIFORMITY.**

Hundreds of Dairymen Endorse It as the BEST Color.

CHACE'S Watering Device

The most perfect watering device on the market. It is fitted with a brass bushing that screws through the bottom of basin and forms a valve seat for the ball valve. The ball valve is the most practical of any now in use; it has been adopted by manufacturers of injectors for steam boilers, and many devices where a perfect working valve is necessary. Send for circular and price.

F. H. CHACE, Sherman, N. Y.

number of the large audience attending the convention, its distance from the opera house, the principal hotels and the icy, slippery condition of the walks, during the last two days, being the cause. Had such crowds thronged it as did the two halls at Gouverneur, there would have been found a lack of room; as it was, however, those who did go, found room enough and a plenty of time on the part of the exhibitors to give information relative to their wares.

There was about the same number of dairy machinery and supply exhibits, as at Gouverneur, but those of butter and cheese fell far short in number, the entries being 158, as against 367 at Gouverneur—less than one-half. Following are the scores:

Class 1—Creamery butter in tubs of 25 lbs. or over, $55. No prizes awarded to scores below 94.

Edgar Grennell Popular Ridge, N. Y..... 98
Henry Eibert, Otisco and Borodino Creamery Co.,..... 97¾

Class 2—Creamery butter in prints, not less than 10 lbs, $30

Thomas F. Rutherford, Chipman, N. Y..... 97¾
George W. Carmon, Mecklenburgh Empire Cheese Co., New Berlin..... 97¾
Fisher Brothers, Madrid..... 96¼

Class 3—Butter in packages of 5 lbs. or over, $65.

Charles Hart, Mc.Lean..... 98¼
Dotshome Dairy, Fayetteville..... 98
W. H. Knapp, Cortland..... 98

Class 4—Dairy butter in prints of 5 lbs or over, $30.

M. N. Butts, West Clarksville..... 98¼
J. Rosenbarker, Lowville..... 98

CHEESE.

Class 5—Cheese for export, $55.

E. P. Dunaway, East Rodman,..... 99
H. L. Grant, Rensselaer Falls..... 97¾
D. A. Goodrich, South Champion..... 97¾
Charles Kirkland, Redwood..... 97¾
Hugh Kirland, Redwood..... 97¾
Levi J. Snell, Clayton..... 97¾

Class 6—Home-trade cheese, $55.

Charles Kirkland, Redwood..... 99½
F. P. Dunaway, East Rodman..... 99½
D. E. Kent, South Easton..... 99
L. E. Meriben, Triangle..... 99

Class 7—Young America cheese, 10 lbs. or under, $ 0.

Cornell University..... 97

No other scores reported.

FANCY CHEESE.

Class 8—Sage cheese, $10

J. H Searl, Lowville..... 97
P. C. Parkinson, Watertown..... 96

Class 9—Neufchatel, $5.

Jared Van Wegenen, Jr., Sawyersville..... 98
Empire Cheese Co., New Berlin..... 96

Class 10—Square Creams, $5.

Empire Cheese Co., New Berlin..... 98

O A. Weatherly, Norwich..... 97
G. H. Boyd, Norwich..... 95

No entries for Edams or Swiss.

Class 14—Limburger, $5.

Empire Cheese Co, New Berlin..... 99

No other scores.

There were, besides the cash prizes, several others including silver cups, medals and Jersey bull calf by Mr George Sisson, Jr., of Potsdam. The cup given by Mr. A. R. Eastman, of Waterville, was of coin silver, elegantly designed and finished; the others, I was informed, were plated goods, but were fine in finish and design. The list of scores I received did not include the names of those winning ones of these special prizes.

The machinery and dairy supply exhibits were as follows:

DeLaval Separator Co., ten machines, both hand and power.

Mosely & Stoddard Co., Rutland, Vt., churns, vats, butter worker, Babcock tester and dog powers.

Empire Separator Co., Newark, N. J., full line of cream separators.

F. B. Fuller, Governeur, double action hand cheese curd mill, also a power mill.

Genesee Salt Co., large exhibit of salt in various sized packages.

G. W. Gazely, Cortland, model milk cooler.

Oaks & Burgess, Cattarangus, dairy supplies.

Alderney Butter Color Co., New York and Newark, N. J., butter color.

A. H. Reid & Co., Philadelphia, Pa., Reid's cream separators and pasteurizer.

L. R. Lewis, Cortland, milk coolers, aerators and feed cookers.

Worcester Salt Co., New York, salt,

P. M. Sharpless Co., West Chester, Pa., Sharpless tubular cream separators.

Champion Milk Cooler Co., Cortland, full line of milk coolers, aerators, milk bottle caps and other dairy supplies.

Diamond Salt Co., Michigan, salt.

The Dicks Agricultural Works, Canton, Ohio, "Blizzard" ensilage and fodder cutter, with blower attached.

St. Albans Foundry Co., St. Albans, Vt., tread powers and fodder cutters.

Thatcher Manufacturing Co., Potsdam, N. Y., Thatcher's pure orange butter color.

Wells, Richardson & Co., Burlington, Vt., large and attractive display of their celebrated butter color.

Taber Pump Co., Buffalo, rotary pumps for cream and whey.

Creamery Package Co., Chicago, Ill., full line of supplies, including butter packages, weighers, tubs, automatic skim milk weighers, churns, etc.

Vermont Farm Machinery Co., churns, butter works, tread powers, butter packages and a full line—several sizes—of the United States separators, both hand and power machines.

Willard Knapp, Cortland, N. Y., Willard Knapp cow tie.

G. H. Grimm & Co., Hudson, Ohio, champion evaporator for maple syrup.

D. H. Burrell & Co., Little Falls, N. Y., combination churn and butter worker, Gang cheese presses, dairy supplies, and Chris Hansen's laboratory of cheese and butter color extracts, etc.

The Fowler mowing machines.

Knife grinders, by the Toughennock Wheel Co., Cortland, and the Smith, Lee & Co., health milk bottle cap company, of Canastota.

Of all the various exhibits at this hall, the one attracting the greatest number of visitors was the "Blizzard" ensilage cutter, fan and blower, which was located in a tent outside the hall and which was run by steam. It was cutting dry corn stalks, and blowing them through its long elevator in great shape, but the noise of its rapidly revolving fan was louder than that of old ocean, and could be heard several blocks.

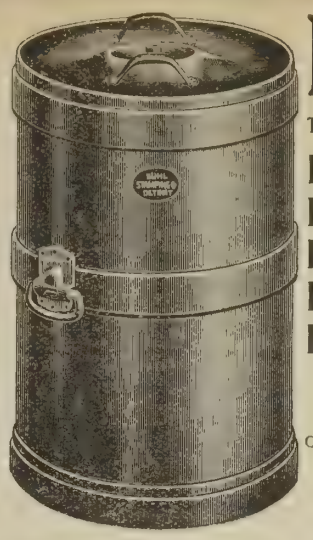
FLABBY FELLOWS

WHO WANT TO BUILD UP THEIR BODIES WILL FIND THE "ONE THING NEEDFUL" IN



DR. PIERCE'S GOLDEN MEDICAL DISCOVERY

The body is built up from the food we eat. But before food can be assimilated by the body it must be prepared for assimilation by the stomach and other organs of digestion and nutrition. *Food does not feed when the stomach is "out of order."* The result is, weak muscles and flabby flesh. "Golden Medical Discovery" heals diseases of the stomach and digestive and nutritive system. It works with Nature to make manly muscle and form firm flesh.

In a letter received from A. D. Weller, Esq., of Pensacola, Escambia Co., Fla. (Box 544), he states: "I have, since receiving your diagnosis of my case, as stomach trouble and liver complaint, taken eight bottles of the 'Golden Medical Discovery' and must say that I am transformed from a walking shadow (as my friends called me) to perfect health."

Experience With Milk Fever.

ED. HOARD'S DAIRYMAN:—On page 936, you ask if some of the readers of HOARD'S DAIRYMAN know of any deaths by milk fever, when cows have been milked without drying off from one calving period through another. Although it is not exactly what you ask for, I will try and tell you what I experienced some twenty years ago.

In the first place, I then lived and worked with my father on a dairy farm, at Friesland, (the motherland of the so-called Holstein-Friesian cow). We milked about 25 cows, all the year around, and, as a rule, they all came in fresh from about December until April of the next year.

Of course, once in a while it would happen that we could not get cows due to calve just at desired time, and that was the case with one of our cows, which we called Dora. She then was ten years old, registered in the Friesian herd book, and a very heavy milker.

As a rule, we dried our cows off some six or seven weeks before calving time, feeding them in that time, all the good hay they would eat clean, and a mixture of about three pounds ground oats and seven pounds oil meal per day.

The cow Dora was due to calve in August. Pasture was very good, and some six weeks before calving time, she gave two gallons of milk at the time, yet father concluded to keep on milking her, and so we did. One night I noticed that she would come in, and I put her in the barn, well bedded and in a comfortable place. The next morning she got her calf, and, as we always did, I took the calf away from her right away. I milked her a little; gave the milk back to her; put a warm blanket on her back; and gave her an armful of new fresh cut grass to eat.

After she had cleaned herself, I milked her again, and gave her a bucketful of luke warm water. She seemed to be sound and hearty, and the next morning, I turned her out again, and she went with the other cows to pasture.

It happened that father and myself went to a certain place on business that day, so that the care of the cows was left to the women folks. About noon a big thunder cloud came up, and for about an hour it rained, a down pour. About 5 o'clock we came home again, and my first thing was to look after Dora. I found her about one mile from home, lying down. I made her get up, and while she did so, I noticed that she was stiff in the hind legs, and kind of stumbling. Of course the very first sign of milk fever, at least as far as my experience goes.

I drove her home slowly, and put her back in the barn; carried more straw in, and gave her another wool blanket. Immediately after this I gave her 1½ lbs. of Epsom salts, and 3 teaspoonfuls of ginger. Then I tried to milk her, but I could get only a few strippings. She soon laid down again and seemed to be in misery, as she kicked continuously with her hind feet, and groaned right along. Her nose was very dry, and she felt cold all over the body.

Father came out and gave her a bottle full of wine, as warm as she could bear it. Shortly after this, the pain seemed to moderate, as she quit kicking and looked to be more easy all over. I staid with her all night, kept her well blanketed, and gave her another quart bottle full of wine.

About noon of the next day, she tried to get up, but she was too weak in the hind part. She ate a little bran, mixed with fresh butter milk, and a couple of hours afterwards she got up. We didn't feed her anything for the first two days but a little warm bran, and a handful fresh cut grass, now and then. She got over it all right, but didn't do as well as usual, and as she was getting a little old any way, we sold her the next year to the butcher.

The second case I experienced was as follows: In September, 1897, I took charge of a 50-cow dairy, belonging to Messrs. Shelly & Bro., of Holgate. As the bull was always running with the cows, they could not tell me very much about the calving time of the cows. After a couple of milkings, I noticed that one of the cows, a fine registered Jersey, was due to calve pretty soon; and as I always have been taught, that it is more dangerous to dry a cow off, if she is springing bag (the best term I can find for it) I thought it better and continued milking.

In about two weeks she had her calf in a box stall kept for that purpose. I left her with her calf for about 15 hours, and as the weather was dry, and not very cold, I turned her out again about 11 o'clock. The next morning about 3 o'clock, I put her back in the box stall (which I had cleaned out and bedded with fresh straw), milked her about 6 o'clock, and fed her a bran mash and some corn fodder. The next morning at 5 o'clock, I went in to feed her, and then I noticed that she was lying down, and as she tried to get up she fell down again. I gave her 1½ lbs, Epsom salts, and two teaspoonfuls of ginger, and put a good wool blanket on her. The foreman came out too, and we gave her 15 drops of aconite, mixed in water. I repeated this twice more, but it was of no avail, the cow died about 4 o'clock of the same day.

As you see, the two cases took place under different circumstances, and the result was different too. As to the box stall mentioned above, I ought to say that these are not what I think necessary for a fresh cow. There are four in the big barn, about 8×12, and 10 feet high. They are on the east side, have one window each, but no window lights, only shutters, so that either one of the cows have to be in the draught, or in the dark. If a stall for fresh cows was situated in one end of the barn, where all the fresh cows are housed, so that it is naturally warm there, I think it would be better, as I always have been taught that catching cold has a good deal to do with milk fever. In the old country we leave the cow at her place and take the calves away from her right away.

Holgate, Ohio. J. HEILEMAN.

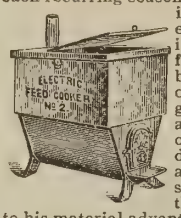
A Herd Yield and Silo Question.

ED. HOARD'S DAIRYMAN:—Permit me to say that through your teachings, both in feeding and care of milk, we have been able to churn from our 12 cows 3,630 pounds of butter, besides cream and milk used in our family and milk for young calves. One of the cows was bought last spring and came fresh the 15th of May, and we sold two in November, which gave still some milk, so that we could not really call it 12 cows. As we have plenty of silage to feed this summer, we will try to do a little better this year.

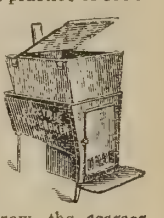
We fed out a silo made in Kalamazoo, and there was not more than two wheelbarrows molded silage in that one. This year we built one 15 feet in diameter, with twenty feet long 2×6s which we could not draw tight, the staves being not even in width, although we paid $25 per thousand feet. We commenced to feed four weeks ago, and found from six to twelve inches spoiled silage on the sides; in the middle the silage is warm and nice. We had given this silo a good coat of coal tar, but I saw right away that some staves could not come air tight. My plan is to line this silo this summer with paper and one inch flooring. Do you think this a good plan? D. J. de H.

Boyden, Iowa.

Inch flooring would be too heavy to bend round the inside of a stave silo, and if put on the same way as the staves run, there would be the same liability for shrinking and consequent leaking. The easiest way would be to take the silo down and trim the staves so they would come together properly and make a tight joint.



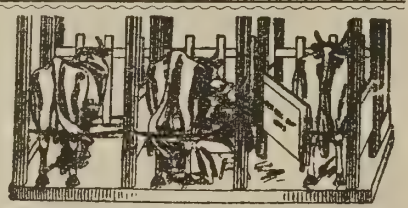
ABORTION PREVENTED



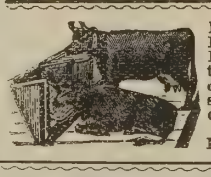
ANTIABORSIO Prevents Abortion in Cows and Cures Scours in Calves.
One gallon treats twenty cows three months. These are established facts, not experiments. Our remedies are Liquid Germicides for sprinkling in closed stables. Booklet and testimonials sent *free*.
ANIMAL GERMICIDE COMPANY, 159 Chambers St., New York.

ILLUSTRATION.

SHALL I BUY A FEED COOKER?



We have no doubt but that this question presents itself to many of our readers in almost this form each recurring season. Many experiments have been made to test the value of the practice of cooking feed for live stock. Such experiments have not always endorsed the wisdom of the practice. Some even have cried it down, declaring that nothing was to be gained by cooking feed, and that the cost of feeding was unnecessarily increased by the expense of machinery, fuel, time, etc. As against these conclusions we are compelled to state that the feed cooker is growing in popularity, daily, and that we have never known a man who cooked feed for his animals, but that was a friend of the practice. One thing is certain, and we believe it is not denied by even the most rabid opponents of the practice, and that is, that the cooking of feed materially increases the succulence, flavor, and digestibility. It transpires, therefore, that the man who cooks feed may employ waste or by-products to his material advantage For instance, straw, clover haulm, pea vines, bean straw, the coarser and harder portion of corn stalks, sorghum, etc., may be made valuable as stock food by steaming or cooking, in combination with a small grain ration. The aroma and flavor of the grain permeates the whole mess, making it appetizing, and at the same time digestible. It must be remembered however, that the simple cooking of feed will not add in any way to its food content—as for instance in the substance above—but it makes that food content appetizing and hence available and digestible.



A very good feed cooker for general use is the "Electric" here shown, which is manufactured by the Electric Wheel Company, of Quincy, Illinois It is well and carefully made of good material and has given excellent satisfaction in the past. Write these people for catalogue, prices, etc. They sell direct to the farmer at wholesale prices.

350 Choice Brown and White Leghorn Young Hens For Sale at $1.50 each in lots of 25 or more. Bred from our prize winners in 4 states. Also **100 S. C. White Leghorn Cockerels** $2.50 each—good ones.

IN THE NICK OF TIME.

For best results seed must be planted at one time—all in one day, or before conditions change. This means even germination, all plants of the same size—a positive advantage in cultivation. The "PLANET JR." No. 4 Combined Seeder and Wheel Hoe meets all requirements. Sows in drills or drops in hills at any distance. Opens the drills, sows, covers, rolls and marks the next row at one operation. By slight and quick change it becomes a hoe, cultivator, rake or plow, throwing dirt to or from rows. It isn't a toy or plaything, but a strong, well made, durable tool of great efficiency and long life.

The "PLANET JR." line comprises in addition, Wheel Hoes, Horse Hoes, Pivot Wheel Cultivators, Orchard Cultivators, Celery Hillers, Markers, Levelers, Potato Diggers, Sugar Beet Seeders and Cultivators, etc. Each implement is equipped with a variety of attachments, making them suited to a number of uses.

The new 1900 "PLANET JR." catalogue, 350,000 of which are now ready for distribution, is in point of beauty, original illustrations and general utility the superior of any similar work ever published. It covers every variety of special and general gardening and farming, both in illustration and text. It's full of points of profit. We mail it free on application.

S. L. ALLEN & CO., Box 1107-D, PHILADELPHIA, PA.

Pennsylvania Dairy Union Dairy Exhibit.

At the Dairy Exhibit held in connection with the annual Meeting of the Pennsylvania Dairy Union at West Chester, December 5th and 6th, fifty per cent of the prizes offered in the creamery butter contest were won by butter-makers who had completed a course in the State College Dairy School.

Mr. E. J. Liekert, Instructor in Buttermaking and superintendent of the State College Creamery, exhibited what in the opinion of the judges was the best butter of the entire show, scoring 98 points out of a possible 100. This is believed to be the highest score reached at a state exhibit this year, and is a good indication of the kind of training which students in the Dairy School may expect. The second prize for creamery print butter, was won by B. A. Burnham, Dairy School '99, whose butter scored 96, and the third prize for creamery tubs was won by J. W. Waite, Dairy School '98, with a score of 94.

When it is considered that these prizes were won in competition with some of the oldest and most famous makes of butter in the world, in the very heart of the most favorably located dairy districts of the state, it is evident that State College dairy students are not only making a reputation for themselves but are reflecting great credit upon the institution that trained them for the work in which they have been so successful.

Warm on Oleo.

Every pound of oleomargarine, of paraffined butter, of new process butter, of renovated butter, or of any other non-butter kind of alleged butter sold and eaten, displaces a pound of real butter. Not only does it displace real butter but it also breaks down the price of the real butter. In this direct, positive way the fraud grease butters inflict a double injury upon the farmers. The fraud greases swell the visible supply, while the demand is a fixed factor. The tenth pound appearing in supply, when the demand is for nine pounds, will compel, practically, the selling of the entire ten pounds for the value of the nine pounds. It is the double effect of these nauseous, dangerous, unwholesome, indigestible frauds that should appeal to the farmers and cause them to unite in demanding extreme severity in laws to punish the adulterators and imitators. Let no false sentiment lead the farmer to look with leniency upon these frauds. Bogus foods are a curse to the community in every way,—in health, in money, in morals, in business. Down with the frauds, the humbugs and the poisoners! The chicken thief, the forger, the perjurer, the embezzler and the highwayman are bad, but they are angels of light and models of honesty and philanthropy in comparison with the demons who make an insiduous attack upon the community with the weapon of poisoned foods of all sorts.—*New York Farmer.*

CONCERNING OUR ADVERTISERS.

The importance of cleanliness in the dairy and especially during milking hours, cannot be overestimated, and such appliances should be used that will prevent the adulteration of the milk by filth and "cowy" odors.

The "Ideal" Milk Pail, manufactured by the National Specialty Co., Racine, Wis., protects the milk from the moment it is drawn from the cow, and using this pail makes it possible to secure milk absolutely clean and pure.

The Hon. H. G. McMillen of Cedar Rapids, Ia., the well known proprietor of the Lakewood herd of Jersey cattle, recently said: "We have used them very much. They are convenient, and secure absolute cleanliness in milking; no first class dairy should be without them."

Dr. C. I. Shoop of Racine, Wis., the eminent physician, whose remedies are favorably known by almost every family in the United States, says: "Realizing that there is no food or drink so susceptible to contamination as milk, I became at once interested in your ingenious invention the "Ideal" Milk Pail. Every possible precaution had been resorted to in the past by my manager at the farm, that would insure pure milk, still, previous to the time when we adopted your milk pail, it was impossible to entirely exclude all foreign matter from the milk. I now feel certain that the milk and cream served on my table at home, are absolutely pure."

Raising hogs has of late grown to be a most important branch of farming. The returns made by the hogs when properly attended to, bring in for the grower a large amount of ready cash. Nearly every Agricultural paper has a Swine Department, yet our observations lead us to say that every farmer would do well to take a Swine Journal, especially devoted to Swine, such as BLOODED STOCK, advertised in our columns. It is a business paper on practical lines, and devotes its pages to such items as are of vital importance to the every-day farmer. The March issue will contain articles from well-known writers such as J. A. McDonald, James Fisher, T. A. Stevenson and others. This issue alone will be worth far more than the prices asked for several years subscription to the paper.

The Page Woven Wire Fence Co., Adrian, Mich., have for nine years past issued a paper called *The Coiled Spring Hustler*. The name has been changed to *Page Fence Age*, but it is the same "Hustler" as ever, devoted to the interests of Page Woven Wire Fence, and full of information concerning it. It will be sent free to any farmer who asks for it. We can assure our readers that it is worth sending for. Ask also for their "Blue Folder," which gives complete descriptions of the different styles of Page Fence. When writing, please mention this paper.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

UMBILICAL DROPSY.

I have a heifer 23 months old, that dropped her calf, Jan. 16; seems all right, except that her udder is very large and quite hard, and in front of it is a swelling, extending to the navel, which is soft, and appears to be filled with water. Have given three-fourths of a pound of salts with ginger. R. B. W.
Gasport, N. Y.

ANSWER.

Umbilical dropsy is quite easily relieved by persistent physicking, and by diuretics. Three-fourths of a pound does not act sufficiently upon a full grown animal, Rub the hard portions, only, of the udder, with with strong camphorated spirits, six parts, and common turpentine, two, only, parts. Do this for four rubbings. Then each morning give sixty grains of iodide of potassa in a little water, as a small drench. Use much and thorough massage, daily, and don't forget the thorough physicking. Continue the potassa for 50 to 80 days if needed.

SHRUNKEN QUARTERS.

Please give the treatment for udder when one quarter is smaller than other quarters, and milk secretion is considerably less. No swelling or irritation or stoppage in this.
Palmyra, Mo. G. V. S.

ANSWER.

Can't possibly tell you the reason in your case, there are so many different causes. Besides, you are far from giving the history of the case. Can't even guess or estimate the true condition. May be hereditary; may be the result of accident, etc., etc.

PREVENTING ABORTION.

We have had in our dairy a few cases of premature births in the last 3 or 4 years and an occasional abortion when 5 or 6 months in calf. I am using two of the best disinfectants I know of in the stables and about the vagina, etc. Now I have a number of cows and heifers to come fresh in 2 to 3 months and I am very anxious to know just the proper course to pursue. Have had 3 or 4 calves dropped lately all right but one cow has just aborted. A READER.
Morristown, Ind.

ANSWER.

Your disinfectant is all right. Wash all the hinder parts of the aborting cows thoroughly and burn, or scald with boiling water, all the surroundings. Leave nothing neglected. If you can remove all aborting cows to an isolated position, do so. Your chief help will be strict vigilance. You can try two dram doses of false unicorn daily for a number of days, or 4 drams of black haw for two weeks.

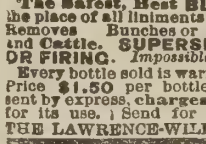
TUBERCULOSIS.

I have a cow, coming four years old, that had her second calf about 1st of December last. Had been perfectly healthy apparently until about a month ago when she lost her appetite. Her skin tightened up and she had a staring look in her eyes. She eats a little bran but does not care for corn. Gave her some physic although her dung was apparently all right, not hard and no unusual smell, but scanty.

Lately I notice a hard lump in each flank, just under the skin, about the size and shape of a hog's kidney, a smaller lump on each shoulder, one on each side of the head, a little below the base of the ear, and one under the left jaw, not on the bone. I would like to know if tuberculosis is surely indicated by the hard lumps under the skin where the cough is entirely absent, and also if a strong, healthy young cow will succumb to the disease within a month. S. G.
Danville, Ill.

ANSWER.

You have a suspicious and dangerous case. It is entirely out of the range of professional correspondence. Get some professional qualified man to make an examination. Your state veterinarian is the best person to investigate your case.



GARGET AFTER MILKING

I had a heavy milking seven-year-old Jersey cow freshen on December 15th. Two weeks before, this cow was milking 18 lbs. daily, and we continued milking her until she calved. For four or five days the milk was stringy or gargety, and was drawn with difficulty. After calving the udder was very much congested, and has continued so until the present time, notwithstanding almost constant treatment, and the attendance of a veterinary surgeon, local application of hot water, fluid extract of lobelia, camphorated spirits, etc., with proper physicking as per directions of DAIRYMAN. To this has been added treatment fluid extract poke root, also iodide potassium (60 grains). At present this cow is giving 12 lbs. of milk daily, when she should be giving 35 to 40 lbs. One quarter gives almost normal amount, while the three other quarters give about one pound each daily. She has been kept on light ration, and local applications with hand massage continued regularly, but improvement has been very slow, if at all. While the congestion has been reduced, the udder is still hard and lumpy, and the milk comes slowly, and only after patient manipulation. W. L. H.
Lincoln, Neb.

ANSWER.

You have exhausted the whole of the best treatment known to me. I can't help your case by any further form of treatment.

Horse Owners! Use

GOMBAULT'S
Caustic Balsam
A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish*

Coloring Matter for Butter.

The writer recently witnessed what might be termed an incipient riot in a high-class restaurant owing to the fact that the butter used on the tables was of the color natural to the season of the year. With one accord the guests pronounced it, on sight, oleomargarine. It was unadulterated butter for which the highest market price was paid. It is unfortunate that the public is not educated to a proper understanding of the natural color of butter at the different seasons of the year, but insist on June color butter at all times. The result is that chemistry is brought into play by manufacturers to produce a coloring matter that will give butter the color as close as possible to that of June butter This winter, as in former years, numerous deaths have occurred thro ugh the consumption of butter colored with materials into which petroleum in some form enters. Admitting that coloring matter must be used by the dairymen, the only safe plan is to use such as are purely vegetable. The color is not so high, its true, and frequently the price is lower in consequence, but no one cares to be a party to the death of some innocent person. It is probable that more stringent laws covering the artificial coloring of butter will be enacted this winter in the several states and thus the practice be stopped. From such agitation may in time come the education of the public so that no artificial coloring need be used. Even the least harmful of them destroys more or less of the natural flavor of the best butter.

The foregoing we copy from the agricultural columns of the Milwaukee, Wis., *Sentinel*.

It was evidently written from the standpoint of prejudice and not sound understanding.

The color question is a matter of vital interest to the dairymen of the United States. Upon that line nearly all the repressive legislation that has been had against the fraud oleomargarine, is based. For that reason, in order that in the future, deception and swindling may be prevented, it becomes a matter of necessity that all butter shall come upon the table in a yellow color.

So far as deaths having ever ensued from the eating of butter that has been colored, that is the merest humbug. Butter is colored simply as a matter of taste, because in summer when feed is green, all butter is yellow. It does not make poor butter, good butter. The coloring has nothing whatever to do with the question of quality. No man need be pursuaded to buy poor butter for good because it is yellow. Quality in butter is not judged by the eye but by the taste and smell, so color has nothing to do with quality but has much to do with another department of value, that of appearance to suit the eye of the consumer.

The aim of the dairymen and all consumers who do not wish to be swindled into buying oleomargarine when they call for butter, is to force oleomargarine by the strong arm of law, to appear in the market and elsewhere in its own distinctive color, which is white or nearly so. Then if the poor want it as a cheap substitute for butter, they can buy it for what it is worth. Public sentiment and understanding is fast coming to see the integrity, fairness and wisdom of such a purpose.

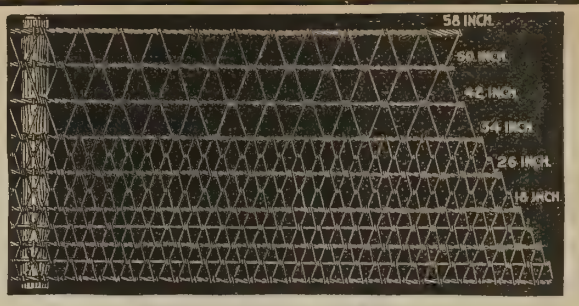
The boarding house or restaurant keeper who puts white butter on his table is lacking in good business sense. No deaths nor even sickness have ever occured, to our knowledge, from eating butter colored by any form of color.

The sooner all butter comes on the table in yellow attire and all substitutes are forced to appear uncolored, the quicker will justice be done to the consumer, and the dairymen.

Does the Udder of a Cow Normally Contain Bacteria?

An article by A. R. Ward in the *Journ. Appl. Micros.* for 1898 has perhaps not received the attention that it deserves. From his studies we learn that great variation exists in the bacteria found in the foremilk, and presumably present in the udder. In the foremilk of a cow he found four or five species of bacteria, only one of which was common to the four teats, but "the same species were found to persist in the same teat from day to day." The milk of another cow examined on five occasions covering a period of eight months, showed three species, one genus of bacteria--streptococcus-predominating in all of the teats at first and persisting thoroughout the trial, yet no streptococci were found in the milk of eight other cows in the same cowhouse.

The results are also given of the bacteriological examinations made of the glandular tissue of the apparently healthy udders of six cows, together with the foremilk of these cows just before they were slaughtered. The udders were divided arbitrarily into three parts, namely, the teat and cistern, the middle part above the cistern, and the part above this. From the examination made it was found that the same organism frequently occurred in the foremilk and in each of the three parts of the udder, and that most of the bacteria obtained belong to one of three micrococci. According to Mr. Ward "the evidence at hand indicates that the teats and the greater portion of the udder may normally contain bacteria. It also seems highly probable that a few at least of the organisms found in the udder remain there after each milking, becoming the progenitors of the organisms found to be present in the milk when drawn." If this be so, milk as it comes from the cow is not sterile, and the micrococcus which produces lactic acid fermentation and sour milk may possibly not enter the milk after being drawn, but be actually present in the milk while in the udder. If it can be shown that the udders of all cows contain normally such bacteria, then it opens up a new field of inquiry.



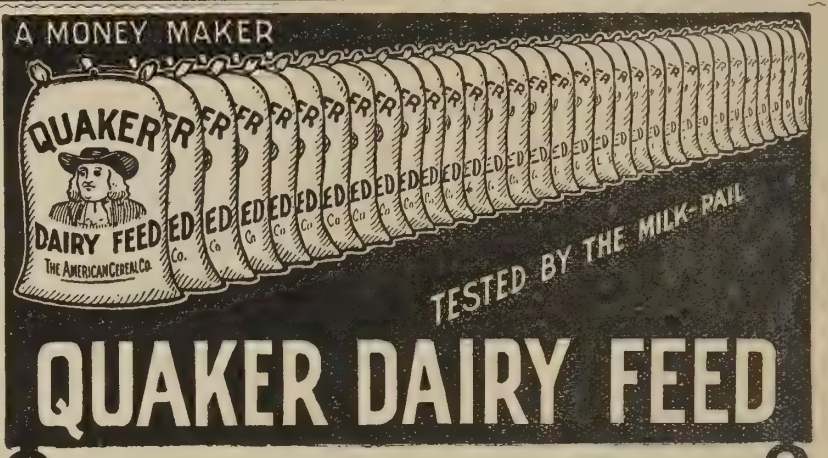
R. HEDGER WALLACE.

As it has always been assumed that the milk from the upper part of the udder, is sterile, it has been difficult to account for the large number of inflammatory attacks to which the udder is subject or for the cause of ropy and stringy milk so often reported. If further investigation proves that bacteira in the udder are responsible for these abnormal conditions, it will simplify to a marked degree, the methods of treatment which are at present decidedly of the rule of thumb variety.

A Good Record.

ED. HOARD'S DAIRYMAN:—I see some remarkable records in your paper of what others are doing. While I cannot make such a grand showing, I think I can beat those Iowa cows. I keep three cows, 2 grade Jerseys and one grade Durham. Besides rearing the calves from the same which took one cow's milk four months and brought me $25.28, and my milk in the house not counted in, I sent to the creamery 15,185 lbs. of milk in ten months, or from the first day of Feb. 1899 to Dec. 1st, 1899, and received in money from the factory $129.17, for the 10 months, making a total in the ten months, from creamery, $129.17; sale of calves, $25.-28; total, $154.45, besides skim milk returned. I am trying to make it from the creamery $150.00 in the year. J. CRONK.

Waupun, Wis.



THE ELWOOD STANDARD

WOVEN WIRE FENCE

is only one of the ten styles we make. We call it our standard because it is designed to meet nearly every requirement of the fence user. Made in **six heights**, as you see it in the illustration, for cattle, horses, hogs, pigs and general farm fencing, this is by all means the Standard Fence, outselling every other fence on the market. **And it's cheap, too.** If you can't find the Ellwood at your dealer's write us for catalogue.

AMERICAN STEEL & WIRE CO., Chicago or New York.

A MONEY MAKER

QUAKER DAIRY FEED

How to Lose Money.

You don't dig potatoes with a corn sheller, do you? Then why should you expect to increase and keep up the flow and quality of milk by feeding flesh-and-fat-making feeds? Or to make your young stock grow, and your mature stock fatten on milk-making feeds? It can't be done. Don't try it, you'll lose money, sure.

QUAKER DAIRY FEED is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal. *Sold only in Sealed and Branded Sacks.*

"Modern Dairy Feeding," an invaluable book, containing scientifically proportioned rations, including every form of roughage and every variety of feed. Sent postpaid on request. Scientific advice on feeding—FREE.

CREAMERY POWER

must be **simple**—easy to handle; **perfectly governed**—economical in its use of steam; **safe**—well and durably made.

The JEWELL AUTOMATIC ENGINE meets these conditions and has many other good points which are best appreciated in service. It is no stranger to the trade. It is "making the wheels go round" today in many of the best managed and most profitable creameries in the country. **Note its clean lines and compact form.** We have a booklet, beautifully illustrated, which has been prepared especially for creamery people.

THE EUREKA BOILER may be used also as a **Steam Feed Cooker.** Serviceable for scalding cans, tanks etc. **Well made,** fully tested, has standard fittings and special pump for injecting feed water without lowering steam pressure. Send for catalogue describing full line. **The C. H. Dutton Co., Kalamazoo, Mich.**

..THIS YEAR..

THE RURAL NEW-YORKER

SUBSCRIBERS are going to receive the prettiest and most valuable novelty ever distributed by the paper. It is the beautiful new climing rose, "RUBY QUEEN," originated by its editor on its own experiment grounds. Roses of similar merit usually sell for 75 cents to $1, when first introduced, but the Rural Experiment Grounds are conducted for the benefit of the readers of the paper, and novelties originated there are distributed free to yearly subscribers. Prizes of $10 for the best, $5 for the second and $3 for the third best cut flower of this rose will be awarded the second year, when it will bloom profusely. The subscription price of THE RURAL NEW-YORKER is $1.00 per year.

We will send it, including this Beautiful New Rose and HOARD'S DAIRYMAN both one year for $1.65

SEND AT ONCE before the supply of roses is exhausted. THE RURAL NEW-YORKER is by all odds the best farm and fruit paper published in any country in the world.

THE BOER WAR

is exciting acute interest in all parts of the world, but the subject of vital interest to agriculturists in all parts of the United States it

How to Make More Money on the Farm.

The surest way to do it is by following in the footsteps of those who are the most successful, and a path is blazed straight and clear through the columns of

THE PRACTICAL FARMER, of Philadelphia.
America's Leading Agricultural Weekly. $1.00 PER YEAR.

It is the only purely agricultural weekly published whose contents are directly applicable in an intensely practical manner to the every day work on the farm. Its editors comprise the leading agricultural writers of the country, and its **Unique Special Departments**—Experience Pool, Short Cuts, Mistakes, Failures and Successes, Farm Implement Annex and Postal Card Correspondence (all of which are supported by contributions from its readers, and for which contributions CASH PRIZES are paid every week), keep it in close personal touch with subscribers every week in the year.

The Practical Farmer's Library, issued quarterly, is one of the most valuable additions to agricultural literature ever published. You can learn full particulars of it in the columns of The Practical Farmer. **The Supply Department** of the Farmer Co., is prepared to quote you an inside price on anything you wish to buy, from a needle to an anchor.

No. 12 Farmers' Supply Catalogue contains 208 pages, illustrated and quoting wholesale prices on hundreds of articles of every day want. It also contains **a complete Calendar for 1900.** Send a postal card to The Farmer Co., 18th & Market Sts., Philadelphia, mentioning HOARD'S DAIRYMAN, and they will send you sample copies of The Practical Farmer, also a copy of No. 12 Supply Catalogue. **WRITE TO-DAY.**

SPECIAL OFFER.—By special arrangement with The Farmer Co., we are enabled to offer The Practical Farmer and HOARD'S DAIRYMAN both one year for **only $1.50.** Address all orders to

SPECIAL REDUCED PRICE FOR THIRTY DAYS

Take advantage of our special offer and get the **IMPROVED RELIABLE FEED COOKER, TANK HEATER and STEAM GENERATOR** one of the greatest feed savers, labor savers and money makers the feeder can possibly have. Cooks a barrel of ground feed in 30 minutes; 25 bushels of ground corn in 2 hours; heats a barrel of water hot enough to scald hogs in 20 minutes; will heat water in tanks 100 feet from cooker. Used and recommended by feeders throughout the United States and Canada. Highest awards at Omaha Exposition in 1898, and at Toronto, Canada and Dallas, Texas in 1899, and at State Fairs everywhere. Sold on a positive guarantee. Your money back if it does not come up to the contract. Send for 1900 Century Catalogue and introduction price. **It has no flues to rust out or leak. No scorched feed if you use it. The best machine of any kind proves the cheapest in the end.**
RIPPLEY HARDWARE CO., Box 20, Grafton, Illinois

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK

should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

The "All-Over" SELF GAUGING Butter Printer

The "All-Over" seems to be pleasing every man who gets one. It prints the butter on the top and on the four sides, also on the bottom if so desired. This not only insures a very attractive looking package, but no matter how it is cut for table use, the imprint of the maker can be seen and his name and reputation more extensively and profitably advertised. To print on all sides it is necessary that the butter should be pressed from every direction, just as the "All-Over" does it, and thus there is no smearing or scraping of the butter against the sides of the mould. The "ALL-OVER" is self gauging, simple, rapid, durable and cheap. We would like to send you one—it will please you.

YOU NEED SOME NEW MACHINERY

with which to handle the increased milk supply next spring, and a good time to put in the machinery is right now, before the heavy business is upon you. We know you would like to have your factory right up-to-date with first-class machinery all the way through, and we think you would just as soon buy it from some one

NOT CONTROLLED BY THE TRUST.

If we are right, we feel at liberty to ask that you turn your orders our way. We are manufacturing a superior line of goods and selling them strictly on their merits. We want to figure with you on complete outfits or any part of an outfit. Perhaps a glance at the following will suggest something upon which you would like information and prices.

A Hollow Bowl Separator.

Much is said about Hollow Bowl Separators, but probably many do not understand what it means.

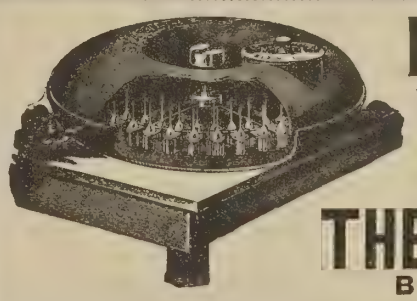
There is the old style hollow bowl separator—bowl shaped like a turnip with the center hollowed out. These are no longer made. The disc machine man tries to fool customers into thinking that other manufacturers continue to make them. In reality he was the last manufacturer to abandon them.

Then there is the tripple current bowl, which has three times as many currants as any bowl should have. The Disc man insists that it is a hollow bowl.

Then there is a bowl filled with plates, lampshades, or whatever you may be pleased to call them, the manufacturer of which "hollows" long and loud about them—much more indeed than the facts will warrant. This may be called a hollow bowl only because it makes the fellow "hollow" who has it to clean.

Then there is the new and distinct type of hollow bowl used in the

Sharples Tubular Separator.



This is a true hollow bowl. There are no complications in it to get out of order, make it dangerous, hard to clean or expensive to repair.

Nobody but ourselves has ever been able to make such a bowl. Others can not and dare not do so now by reason of our patents. The virtues of our Tubular bowl are rapid, clean skimming—above any bowl of any kind in existance. It is safer, lighter, easier driven, easier cleaned, easier repaired and less liable to need repairs than any other. These are the fine points in a separator. Any man who buys one of these and uses it recommends it above all others. Especially is this true of the man who is familiar with the weak points of other kinds.

If you want the Best Separator the World has yet Seen, We want to Sell it to You. . . .

Send for Catalogue No. 46.

A Day Off.

And a Holstein Herd Visited.

A couple of representitives of Hoard's Dairyman had the pleasure a few days since, while en route elswhere, of visiting and inspecting the buildings and herd at McGeoch Farm in this (Jefferson) county. The farm, which consists of nearly five hundred acres, with not a foot of it that cannot be cultivated, lies within the boundaries of the ancient city of Aztalan, where in years long before the white man settled in Wisconsin, and indeed so long before, that the Indians have no tradition concerning them, this particular locality, was inhabited by a race of men who built here extensive fortifications, temples and sacrificial altars. The country did not abound in stone or other building material, and hence these works were constructed of common soil, but it was soil brought thither from no one knows where. No pits or other excavations have been found indicating that any of the material used in building these mounds, walls or other structures was taken therefrom.

It is plain it was from these pre-aboriginal structures that the place in the earliest days received its appellation of "The Ancient City", notwithstanding it was the site of some of the earliest settlements in the history of Wisconsin, and at one time was seriously discussed as the proper location for the territorial capital. For reasons, which at this time it is impossible to fathom, Aztalan did not become the place of importance that its earliest settlers anticipated. Other localities got the start of it, and its prospects soon dwindled, and it is now practically only a four corners, with a school house, a church, a postoffice and a modern creamery, and would now have little or no distinction, if it were not for the McGeoch Farm.

The present owner of the farm resides in Milwaukee, and a little outside the limits of that city he has another large farm devoted to the production of milk and cream for city consumption, but both the Milwaukee farm and the Aztalan farm are under the efficient general superintendency of Mr. H. B. Daggett.

The Aztalan farm, a year or two ago, acquired some notoriety, because of the erection there of the largest silo in the world, so far as known. This structure is round and has an inside diameter of 66½ feet, and a corresponding height. We have always been of the opinion that this was altogether too large for convenient use, and we found this opinion corroborated by that of Mr. Daggett and the herdsman in charge of the cattle. The silage, however, seems to keep perfectly and was of first quality, as we examined it at the time of our visit.

There is, of course, on a farm of this size, and with a silo of this capacity, a very large herd of cattle, sufficiently large perhaps to feed off all that is required to keep the silage in good order, but the principal objection is that so much of the silage has to be carried such a distance to get it outside into the stables. However, in this particular instance there is a stable on either side of the silo, with openings into them, so that the silage only has to be moved at the farthest, a little over thirty feet; but even this distance imposes an unnecessary amount of labor, and we think it would be far better if Mr. McGeoch had two or three or even four silos in place of the large one.

The day did not turn out as pleasant as the promise of the morning indicated, and in consequence we were unable to make as full inspection of the premises as would otherwise have been the case. This was, however, partly compensated for by compelling us to devote more attention to the large herd of milch cows, present and prospective. Until very recent years Mr. McGeoch, following the example of his father, has kept his farm stocked exclusively with grade Holsteins, but at the present time he has sixty or more registered animals of various ages, and is now raising both registered and grade stock, although a stranger would have much difficulty in determining which were grades and which were thoroughbreds, were it not for the circumstance that the thoroughbreds have their names attached to their stalls.

The principal cow barn is 250 feet in length and we have the same fault to find with it that we do with the silo; it is too large. This objection, however, is founded upon a different reason from the one with the silo. In case of a fire in this building, it would be practically impossible to save any of the stock, whereas if the animals here quartered were put into three or more barns, there would be at least opportunity for saving the greater number of them.

Notwithstanding the inclemency of the weather, our visit happened to be very opportune in that Mr. Daggett was having some of the cows officially tested, and we had the opportunity of witnessing the *modus operandi* of conducting these tests under the rules adopted by the Holstein-Friesian Association. We found a young man from the Wisconsin Experiment Station, a Mr. Nicolaus, there in charge. The noon milking was under way, and we observed, that he allowed only one cow to be milked at a time, and that he stood close by and gave his undivided attention to the milking of the cow. When the milking was completed he took the pail to the scales, weighed the milk, then took a sample for testing and afterwards turned the milk into the strainer. Had there been ever so much disposition, and we are firmly convinced there was none at all, to get in any crooked work, we do not see how it would have been possible. We observed that Mr. Nicolaus was very careful in taking his sample, and that as soon as taken, he unlocked his tin box and put the sample therein, being very particular to see that the box was afterward locked.

Undoubtedly the results of this test will be made public sooner or later, but we apprehend that it is no violation of confidence to say here that one of the cows—and one in which we took particular interest—by name, Melisse Clothilde, gave 26½ lbs. of milk at the noon milking, and that this milk tested in our presence 4.8% fat. It is not for us to say what she did at other milkings, or what she may do subsequently. It suffices to say that the milk drawn in our presence at noon that day had enough butter fat in it to make 1.84 lbs. of butter, estimating the yield by adding one-sixth to the amount of fat in the milk.

Holstein-Fresian breeders in Wisconsin and elsewhere may well perpare themselves for a competitor at McGeoch Farm that will not be content to be in the rear ranks.

GRADE GUERNSEY COW, BEULAH.

Property of R. F. and A. H. Parker, Southville, Mass.

Cheese or Potatoes.

A Question for J. A. M. and one for Hoard's Dairyman.

Ed. Hoard's Dairyman:—Since I subscribed for your excellent paper, I have not neglected to read an issue and have been very interested in the various expositions of your numerous correspondents, and should now like to gain further information from J. A. M. in his argument for "Dairy Farming," in your issue, No. 40.

In comparing the gain from cheese as against raising potatoes or oats, he neglects to consider the capital invested in the cows, which produce the cheese (indirectly). In other words, to make a fair comparison, I should think the total capital invested in each business, be it in labor, expenses, food, etc., should be considered. Also, would there not be some commercial fertilizer, which could replace the lost fertility, at a less expense than the investment of capital in stock?

I ask these questions for the sake of information, not that I doubt the stand that J. A. M. takes, for I am not acquainted with all the circumstances surrounding him on Prince Edward Island.

Please give me a balanced ration from the following feed: Wheat hay, $6 a ton, or barley hay, $5; bran, $14; oats, $20; alfalfa hay, $2.50. Raise all the hay and grain, with exception of oats; ground barley $16; have all the straw I can use. A. J. L.

Salinas, Cal.

We leave it to J. A. M. to answer at his convenience the inquiry which seems to be addressed to him in particular.

If we were living in California, and could have alfalfa hay in plenty, at the prices named, we should not care to feed very much other hay; but if there is no other market for it, and we had the hay on hand, of course we should use more or less of it as circumstances might suggest.

Fifteen lbs. of alfalfa with 6 lbs. of ground barley and other hay and straw *ad libitum*, would make a very good average ration for a herd of cows. Some should have more, of course, and some less.

For a Herd of Holstein-Friesians.

Feeding to Effect Sex of Progeny.

Ed. Hoard's Dairyman:—Please give us a ration for pure-bred Holstein-Friesian cows weighing about 1,100 to 1,500 lbs from feeds at about following prices: Timothy hay, $6 per ton (clover froze out last year); oat straw, $2 a ton; corn silage, $2 a ton; corn, 25 cents a bushel; oats, 23 cents a bushel; barley, 27 cents; bran, $11 a ton; old process oil meal, $20 a ton.

We have an arrangement for grinding corn and cob. Would like to fix up a feed from above that will give us best results in our dairy. W. B. Barney & Co.

Hampton, Iowa.

The price named for oil meal is a bit suggestive to us that there may be something the matter with it. From almost every other quarter oil meal is reported to be selling for from $26 to $30 per ton. If this meal is all right, we would suggest a ration practically as follows:

Formula for Ration.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.91	.39	4.20	.21
5 lbs timothy	4.34	.14	2.17	.07
5 lbs. oat straw	4.54	.06	1.93	.04
5 lbs. corn & cob meal	4.45	.32	3.15	.18
5 lbs. bran	4.41	.63	1.93	15
2 lbs. oil meal	1.82	.59	.65	.14
Totals	27.48	2.16	14.03	.79

This of course is a pretty large ration, but it is intended for large cows, and it is to be expected that many of these cows are preparing for freshening again, and so will not need so much, especially in protein; while others in full flow of milk may need more protein. The cheapest source for this protein may be in oil meal, or possibly, in gluten feed.

We may remark in passing, as a matter of some interest to breeders of pedigreed stock, that according to the theory advanced by Prof. Schenk, of Vienna, Austria, a ration of the above character, ought to result in a preponderance of heifer calves. The Professor's theory is that sex is determined by the character of the nourishment supplied to the mother, and that a highly nitrogenous or protein diet tends to the production of masculine offspring, whereas a diet lower in protein tends in the opposite direction. It would probably be of some interest and profit if breeders would make note of this theory and compare it with results which they may have observed in the past, or that may come to their attention in the future.

A Massachusetts Guernsey.

Ed. Hoard's Dairyman:—Knowing that you are interested in photographs of good dairy animals, I enclose a picture of a grade Guernsey cow of our herd.

The Guernsey grade cow, Beulah, was bred by a farmer, of this neighborhood, is about seven years old; gave in 52 weeks, Nov. 3rd, '98 to Nov. 2nd, '99, 7282¼ lbs. of milk, average test about 5.2%

Allow me to take this opportunity to congratulate you on the excellent work the Dairyman is doing for the cause of clean, scientific dairy business and to assure you that we get a great deal of interesting knowledge from the columns of your valuable paper.

R. F. & A. H. Parker.

Westborough, Mass.

THE COW IN ANCIENT LITERATURE.

How little we realize in our daily contact with the cow what an important part she has played in the remotest literature of the past.

The Rig Veda, the ancient scriptures of India, contains mention of Traitana, one of the divine powers which ruled the firmament, "destroying darkness and sending rain." To this divinity was given the office of rescuing the celestial cows and slaying the demons that had carried them off. "These cows," as Max Mueller tells us, "always move along the sky, some dark, some bright colored. They low over their pasture; they are gathered by the winds and milked by the bright rays of the sun; they drop from their heavy udders a fertilizing milk upon the parched and thirsty earth. But sometimes, the poet says, they are carried off by robbers and kept in dark caves near the uttermost ends of the sky. Then the earth is without rain, the pious worshiper offers up his prayer to Indra, and Indra rises to conquer the cows for him. He sends his dog to find the scent of the cattle, and after she has heard their lowing she returns, and the battle commences. Indra hurls his thunderbolt; the Maruts ride by his side; the Rudras roar; till at last the rock is cleft asunder, the demon destroyed and the cows brought back to their pasture."

This is one of the oldest myths or sayings current among the Aryan nations.

Surely if the cow has furnished such inspiration to the most ancient of poets, shall she not be deemed worthy of a tribute of praise from the farmer of to-day, whom she has so often saved from many a devastating financial drouth?

COMPARATIVE FIGURES.

The North Carolina College of Agriculture is devoting good thought and effort to the object of arousing a truer comprehension among North Carolina farmers, of what they must think and do to be saved in a dairy way. The human nature of the North Carolina farmer is like all the rest of us, for that matter. He does but very little more thinking and working than he is obliged to. Whereas, all wealth, knowledge, progress and influence among men is based on earning, thinking and working, every day, a little more than we need for that day. That is the only way we can have a surplus against the time of supreme necessity.

Bulletin No. 166 of the North Carolina College contains the following figures:

On the first day of January, 1899, there were 248,263 milch cows in that state, which were valued at $2,947,382, or $15 a head. For the sake of instruction the Bulletin gives the cow population of Connecticut which was 143,098, valued at $5,087,134, or $35.55 a head. In the year 1890, according to the United States census, Connecticut had 127,892 milch cows, which produced 10,369,259 pounds of butter, or about 81 pounds per head.

During the same year North Carolina had 223,416 cows, which produced 13,129,374 pounds of butter, or about 59 pounds per cow. At that rate, in 1899, the cows of that state would have produced 14,573,038 pounds of butter, which, at 20 cents a pound, would be worth $2,914,607.

The real lesson to be learned from these figures, by both North Carolina and Connecticut farmers, is the low product per cow.

Where such returns exist in a state, as a whole, there can be no wonder that so many men can make no money with cows.

However, it drives the question home upon the farmer himself, as being the cause of all this low return to his own pocket. Just as long as the farmer, whether he lives in Connecticut or North Carolina, or anywhere else, maintains a low standard of judgment concerning the cow, concerning how she should be bred, fed, housed and managed, just so long will every public and private census show such poverty stricken results.

It is the low state of dairy knowledge and, as a consequence, the low standard of ideas and judgment that is ailing these average farmers everywhere. Occasionally, there is found a man among them who looks at things differently. He realizes that there is bigger profits in good knowledge and good ideas; he reaches out for them and they, in turn, enrich his life and his pocket. There is hope for such men. But there is no hope for men who won't look, won't listen, won't read, won't think, and so continue to "fry in their own fat."

THE SAME OLD UTOPIAN DREAM.

B. V., a correspondent of the *Minneapolis Tribune*, puts up the same old dream about a "dual-purpose cow" that has cursed so many thousands of farmers; which idea is behind all the poor, no-purpose, good for nothing cattle these farmers have and have always had. No one on earth ever saw them set in, in dead earnest, to breed for a special-purpose cow.

This is the way he closes his communication:

"Once in a while we find a cow that al most meets the requirements, and the owner of such a cow should value her at a high price, for properly used, she may be the foundation stock for a family that will work a great change in the typical cow for American dairies There are no herds of dual-purpose cows in existence just now so far as I know, but here and there such a cow may be found. Some one will make himself famous by founding the dual-purpose breed."

He is frank to admit that there are no such herds of cattle, only here and there a sport, which no man, of sound ideas of breeding, would ever think of getting a heifer from of the same character. Oh, this idea dies hard in men who can't for the life of them show any practical working out of such contradictory ideas.

OLEOMARGARINE AND CANDIDATES FOR GOVERNOR.—AN ILLINOIS CONDITION.

Judge Hanecy, of Chicago, is an active candidate for the nomination as governor at the Republican state convention in Illinois, and it is beyond dispute that he will have the active support of the people and the interests that were not long ago the recipients of his judicial favors, even if it cannot be demonstrated that they were the instigators of his candidacy.

A copy of the Dixon *Telegraph* lies before us containing a communication to that paper from an anonymous correspondent, which consists, primarily, in a condemnation of those farmers and dairymen in that state, who are opposed to the nomination of Judge Hanecy for governor, and have the courage to say so, and, secondarily, in a labored and unsuccessful attempt to justify the action of this judge in deciding the anti-color oleomargarine law of Illinois to be unconstitutional. The communication concludes with the plea that, whether Judge Hanecy's decision on this subject was sound or otherwise, he is an honest man, and his decision in the oleomargarine cases represents his candid opinions and was not induced by favoritism to the oleomargarine interests, or by hostility to farmers and dairymen, and hence he should receive the support of dairymen.

HOARD'S DAIRYMAN is of the opinion that not one of these contentions is tenable. Judge Hanecy is irrevocable and in the most solemn and binding manner committed to the doctrine that oleomargarine as a butter substitute has not only all the rights which pertain to genuine butter, but also has the right to mask itself in the guise and color of butter so that consumers cannot detect the genuine from the spurious. Appellate courts may overrule Judge Hanecy's decisions, but they cannot reverse his convictions. As governor of Illinois, if he should be nominated and elected to that office, he would of necessity be governed by these convictions in all his official acts. Having thus proclaimed himself the friend and defender of oleomargarine, it follows that to the extent that oleomargarine is inimical to the dairy interests and offensive to the consumers, who prefer the genuine product of the dairy and the creamery to the substitute from the stockyards and the slaughter houses, Judge Hanecy is inimical and offensive to them.

It is, therefore, both right and proper—indeed their duty—for everyone who disagrees with Judge Hanecy in this proposition to oppose his nomination, and to agitate and combine, publicly and otherwise, to compass his defeat. In the diplomatic phrase so common in these days, he is *persona non grata* to a large and not unimportant part of the electors of Illinois, and to impose his candidacy upon them would be the highest degree of partisan folly.

In view of these facts it is not a particularly pertinent question at this time whether Judge Hanecy's decision was "good law." It remains for the Supreme Court of Illinois to determine this matter whenever the oleomargarine crowd will permit a case to be taken to that court for decision. But meantime, it may be said that he enjoys the unenviable distinction of holding opinions diametrically opposed to the decisions of every court of last resort, whether state or national, that has passed upon this question. It is not true, as stated by the *Telegraph's* correspondent that the Supreme Court of the United States "held a simular New Hampshire anti-butterine statute void," or "that the Supreme Court of Michigan recently decided the same way."

An Unsolvable Feeding Problem.

ED. HOARD'S DAIRYMAN:—Will you favor us with your views, if possible, with rations balanced for 40 lbs. of milk, 30 lbs. of milk, 20 lbs. of milk, 10 lbs. of milk, using the feeds named, which will be the most economical to produce best yield from Guernseys and Guernsey-Jersey and Holstein grades. The product sells at 8 cents per quart delivered direct from farm to customer, in bottles.

It is particularly asked that the different quantities of food required for the different yields of milk be given (*vide* page 636, "Feeds and Feeding") in order that the authority may be undisputed and exact as it will be, if given under the "hand and seal" of your good selves.

Bran, $18.50 per ton; gluten feed, $22 per ton; dried brewers grain, $15 per ton; corn meal, $16 to $18 per ton; oil meal, $28 to $32 per ton; mixed hay, $16 per ton.

Sunnymeade Farm, N. Y. P. C. S.

We fear our friend does not comprehend the difficulty that he is leading us into. It is simply an impossiblity to weigh out a given amount of feed, place it before a cow and then settle upon just how much milk will be delivered at the udder. There is the all important question of the individuality of the cow. One cow will give 40 lbs. of milk with no more feed than another will require to make 30 lbs. of milk or less. The careful feeder will always observe the condition of the cows, the amount of milk they give, and then he will be in a position to judge with some accuracy whether to increase or decrease their allowance of feed.

There is, of course, in a way, a law of averages which obtains. So we say in making up a formula for a herd that certain amounts will be found to be not far from right as an average, giving to those cows which require it more than the amount specified and less to others. In like manner, we might perhaps agree with the general principle of the table referred to on page 636 of "Feeds and Feeding," although our personal judgment is that the figures given there are somewhat excessive. If we accept the standard there for oxen at rest in the stall as approximately correct, we see no reason for requiring so much digestible protein for cows giving 22 or 21½ lbs. of milk. It seems to be assumed that it requires 0.9 of a pound of digestible protein to produce the casein in 10 lbs. of milk.

As before said, we think this is unnecessarily high. As a rule, there will not be to exceed 0.35 lbs. of casein in 10 lbs. of milk, and unless there is more loss in transforming the protein of the food into casein of the milk than has yet been discovered we see no reason why 0.6 of a pound of protein should not be ample for this amount of casein.

Reducing the fats in the feeds named to their equivalents in carbohydrates, the following table will give the total nutritive units in the several feeds and their relative value per ton with hay counted at $16, assuming that the mixed hay is clover and timothy in about equal parts.

	Nutritive Units.	*Relative Values.*
Mixed hay	48.4	$16.00
Bran	58.7	19 40
Gluten feed	76.3	25.21
Dry Grains	64.7	21 39
Corn	78 9	26 04
Oil meal	79 5	26.49

From these feeds for a maintenance ra-

tion, we would select 10 lbs. of hay and 6 lbs. of ground corn. This would, of course, give us both more protein and fat than is required for a simple maintenance ration, but we make it the basis from which to figure approximately the additions required for the several amounts of milk specified. To produce 10 lbs. of milk daily we would add, say 4 qts. of bran; to produce 20 lbs. we would add still further 3 lbs. of dry brewers grains; to produce 30 lbs. of milk add another 3 lbs. of the grains; and to produce 40 lbs. of milk we would add 2 lbs. of the gluten feed. The following table shows the successive additions and the totals in each case.

10 lbs. hay	8.53	.48	3.96	.16
6 lbs. corn	5.35	.49	4.00	.26
Totals	13.88	.97	7.96	42
4 lbs. bran	3.52	.50	1.54	.12
Totals	17.40	1.47	9.50	.54
3 lbs. grains	2.75	.47	1.09	.15
Totals	20.15	1.94	10.59	.69
3 lbs. grains	2 75	.47	1.09	.15
Totals	22.90	2 41	11.68	.84
2 lbs. gluten feed	1.84	.41	.97	.06
Totals	24.74	2.82	12.65	90

We have tried in the above simply to give theoretical formulas. Ordinarily we should not feed so much grain and so little hay, but it should be remembered that both the bran and brewers grains are quite bulky, and might almost as appropriately be classed with roughage as to denominate them concentrates. When using any one of these formulas we should deem it almost a necessity to give each cow more or less hay according to her appetite, letting her be the judge.

But after all, there is no mathematical rule that can be followed in feeding, nothing in the way of figures that can take the place of good judgment, nothing in the way of advice that can supplant care on the part of the feeder. When cows are taking on unnecessary flesh, the evidence is conclusive that they are either receiving too much feed or too little digestible protein to enable them to do their best in manufacturing milk. On the contrary, when milch cows grow poor, the evidence is conclusive that they must have more carbohydrates in order to keep up in flesh.

Twenty Cows and No Pasture.

ED. HOARD'S DAIRYMAN:—I keep twenty cows in the barn the year around, as I have no pasture. I mix 400 lbs. bran, 200 lbs. corn and cob meal, 100 lbs. gluten feed, 200 lbs. oil meal. Of this 900 lbs. I feed about 10 lbs. daily to each cow, with 18 lbs. silage of best quality, and hay, what they need, without weighing.

Can you change this in any way to make it better for cows in full milk.

North Hadley, Mass. H.

If this correspondent's cows are eating 10 lbs. of timothy hay, daily, in addition to the silage and the grain mixture specified, the ration will show in figures as follows:

	Dry Matter.	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
18 lbs. silage	4.75	.23	2.52	.13
10 lbs. grain mixture.	8.94	1.58	4.92	.43
10 lbs timothy hay	8.68	.28	4.34	.14
Totals	22 37	2.09	11 78	.70

Whether it is advisable to make a change in this grain mixture, will depend very much upon the local prices of the feeds named. We incline to think, from the prices quoted to us elsewhere in New England, that possibly the cost of the oil meal may be relatively excessive, and where silage is available oil meal is not specifically demanded. By referring to table on page 754, this correspondent will be enabled to determine for himself the relative values of these several feeding stuffs, because he may take the amount of digestible protein in each as showing their relative feeding values to him. It may be well for him, in this connection, to investigate the merits of cotton seed meal for his purposes.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	*Digestible nutrients*		
	Protein.	*Carbohydrates.*	*Ether extract*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen. hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude* fat. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

GLUTEN MEAL FOR HORSES.

G. K., Winfield, Iowa, asks what sort of feed gluten meal would be for horses, colts and all growing stock, and at $16.50 per ton how would it compare with oats at 20 cents per bushel?

We are not aware that any experiments in this line have been reported, and till they have been, we should hesitate about using very much gluten meal for horses or colts. Gluten meal is a very highly concentrated feed, and never should be used unless it is very much diluted or extended with bran, or some sort of chop fodder. We see no reason why it should not prove all right for horses, but in this case, as in others, we think it prudent to "make haste slowly."

SILAGE AND OAT AND PEA HAY.

H. T. F., Clinton County, New York, writes that he is about to sow a few acres of peas and oats and wants to know which would be the better way, let them get ripe and thresh them and get them ground, or cut them when in the dough and feed them in the straw. He wants to feed them to new milch cows. He has now a 100 ton silo and and is going to build two 75 ton ones. Wants to cut down the grain bill as much as he can, and inquires whether if he was to feed from 30 to 35 lbs. of silage and 20 lbs. of oat and pea hay this would make a balanced ration, and if not, what would be required to bring it up to the required standard. He also wants to know whether alfalfa will grow in his county. He asks another question about the merits of two rival silage cutters. He wants our readers to advise him.

The latter is a tabooed question. We cannot undertake to decide personally or let others express their opinions as to the relative merits of machinery. We do this, not because we are unwilling to have the best known, but because it is impossible for a man, no matter what his ability or experience may have been, to determine these questions. He may decide for himself what is his preference, but the chances are that the next man, of equal ability, will have a different opinion.

The other question, whether alfalfa will flourish in his county, is one that can be decided only by experiments there. Whether there has ever been any such experiment made or not, we are unable to state. The best way to determine this is for H. T. F. to get a little alfalfa seed and sow it.

Sow the peas with the oats, or rather a week or ten days before, and when the oats are just coming into blossom cut them for hay.

If he can get his cows to eat 30 lbs of silage and 20 lbs. of oat and pea hay, he will have a pretty fairly well balanced ration for small cows, but we are of the opinion that a little ground corn (not corn meal) would be an improvement and more than compensate for the additional cost. This amount may vary from 2 to 6 lbs. according to circumstances.

A MAINE RATION.

C. E. K., North Gorham, Me., has grade Jersey cows in full flow of milk and makes butter. He wants to feed 25 lbs. of silage, and 6 to 8 lbs. of well cured oat hay. He can buy corn meal at $16.50 per ton; cotton seed meal at $26 per ton; bran at $19; and gluten meal at $30. How shall he feed?

We should prefer a little more of the hay than he specifies, but limiting ourselves to his figures, we suggest the following formula:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
7 lbs. oat hay	6.38	.30	3 27	.11
4 lbs. corn	3.56	.32	2.67	.17
2 lbs. cotton seed meal	1.84	.74	.34	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	21.90	2.19	11.32	75

WHAT KIND OF COWS TO BUY, AND HOW TO FEED THEM.

C. J. K., Ulen, Minn., says that he is working toward a dairy, and his mind has gone out towards the Holstein for cows, but the people in his neighborhood say that such stock finds a poor market, and that the cattle buyers there do not want them.

Very well, if a man has good cows he needs to care but very little about the cattle buyers or the beef market. What he wants is milk and the products that can be made from the milk, and to this end he wants a special-purpose dairy cow no matter what her breed may be. In this respect he may suit his own fancy. If he inclines to favor the Holsteins, by all means let him invest in Holsteins, and if he gets good cattle of this breed he need have no fear of the result.

He can buy bran from $8 to $9 per ton; oats at 25 cents per bushel; barley at 40 cents per bushel, and he has corn fodder and wild hay. Oil meal he thinks will cost him about $40 per ton, as he can only get it at Minneapolis. We should feed very little oil meal at such a price, but should depend very largely upon bran, and feed from 8 to 14 lbs. of this, and all the wild hay and corn fodder the cows will eat.

DOING WELL NOW.

J. W. A., Aledo, Ill., says his cows are looking and doing well, but if there is a chance for improvement he wants to take the chance. He is feeding now about all the silage they will eat, which is composed of two-thirds common corn and one-third kafir corn and sorghum, and in addition 10 lbs. of bran and all the shredded fodder they will eat. Bran is worth $15 per ton; oats, 21 cents per bushel; corn, 26 cents per bushel; oil meal, $30 per ton; timothy and clover hay very scarce and high.

It is about a stand-off between the oats and bran, in our opinion, but if the cows are doing will now, we should hesitate about advising any radical change. It might be well to see what the addition of 2 lbs. (more or less) of oats to the daily allowance would do. Try it first with one or two cows, and if this is profitable, add it to the allowance for all the cows.

Mr. A. adds in a postscript, that he has about as cheap and good a silo as ever was. It is 16 feet in diameter, 31 feet high, and cost only $75, and is all right. We are also obliged to him for the remedy for calf scours which is printed in another column.

NOT A FAIR QUESTION.

A Nebraska subscriber asks this question:

What is the proportionate value of a heifer calf from a well bred Jersey cow and Short-horn bull, or from a well bred Jersey bull and a Short-horn cow? Nobody can tell. It will depend upon the relative prepotency of the sires and dams. If one could have such a cow as the Short-horn grade, Rose, pictured and described in our last issue, with a prepotency in herself inherited from her dams for several generations, he might be pretty sure that her merits would be perpetuated in her progeny whether she was a Jersey or a Short-horn. On the other hand, if one could make sure of a sire that had inherited from two or three generations a very strong current of dairy prepotency he might expect these to predominate in the progeny. It follows, therefore, that the choice between the heifers referred to must be determined, not by the breed, but by the individual characteristics of the ancestors.

AN IOWA RATION.

H. K. G., Jewell, Iowa, has wild (prairie?) hay at $5 per ton; corn fodder somewhat damaged by hail; oat straw; oats quoted at 19 cents per bushel; corn, 20 cents a bushel; and can buy bran four miles away at $10 per ton; shorts at $12 per ton. He also says he don't know what other feeds he can buy or at what prices, but will try and act upon our suggestions.

It is our opinion with the feeds at hand as above mentioned he can do no better than add some oil meal to the list and then use the following formula as a general guide:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn fodder	7.10	.37	4.04	.12
10 lbs. hay	8.75	.35	4.18	.14
8 lbs. oats	7.12	.74	3.79	.34
2 lbs. linseed oil meal	1.82	.59	.65	.14
Totals	24.79	2.05	12.66	.74

To the cows able to give large amounts of milk add more grain. To those that from natural incapacity or because they have been in milk sometime cannot profitably use so much as above specified, reduce the amount.

BARLEY AND PORK.

A California subscriber asks how many pounds of barley it takes to make a pound of pork, and further whether this barley should be fed whole or whether it should be crushed at a cost of $1.00 to $1.50 per ton for grinding.

Prof. Henry's experiments carried on at the Wisconsin Experiment Station show that with pigs weighing 200 lbs. at commencement of feeding period it required 4.7 lbs. of barley to produce 1 lb. of gain in live weight. The barley was crushed and we apprehend that anyone after feeding it whole, would come to the conclusion that it was a very wasteful method of feeding.

STERILIZED MILK.

I am running a milk wagon in our town, and am interested in the subject of *sterilized milk*. Would you kindly tell me through your paper what you can in regard to it, what the process is and the expense of doing the work, etc., and you will greatly oblige.

South Haven, Mich. F. O. H.

Sterlized milk is used to a very slight extent at the present time. It has been given up because the high heat necessary, causes

certain changes in the milk that lessens its value as a food, for children or invalids. What is known as pasteurized milk has taken its place. This consists in heating the milk to 155°F. for 20 minutes and then rapidly cooling it to below 60°F. Milk so treated, will keep for a week if kept in a cool place.

The greatest objection to such milk is the fact that the cream does not rise as well as on raw milk, and thus a false idea of the quality of the milk is given to the purchaser.

It has been proposed to remedy this fault by heating the milk to 140°F. for 30 minutes and then cooling as usual. It is stated that milk so treated will keep as long as that heated to 155°F., and that the cream will rise as well as on raw milk.

There are numerous forms of apparatus for doing the work of pastuerizing, descriptions of which can be obtained from dealers in dairy supplies.

A PENNSYLVANIA RATION.

C. A. C., Clarion, Pa., has cows weighing from 800 to 900 lbs. and wants a ration from the following feed stuffs: No. 1 corn silage; clover hay, $10; wheat bran, $20; corn and oat chop, $20; wheat middlings, $21; old process oil meal, $30. Where one has silage we do not think it necessary or advisable to feed oil meal at present prices. Our suggestion for a ration formula takes the following form:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs silage	7.92	.39	4.20	.21
10 lbs. clover	8.47	.68	3.58	17
8 lbs. bran	7.05	1.00	3.09	.24
2 lbs. chop	1.78	.17	1.04	.08
Totals	25.22	2 24	11.91	.70

A WISCONSIN RATION.

X. X., Richland Center, Wis., requests formula for a ration for cows weighing 800 to 1,000 lbs. He has corn and oat chop made from 7 bushels of corn and 45 bushels of oats; can buy bran for $14; shorts for $15; oil meal for $30. Timothy hay is worth $7 per ton and good corn fodder (stover?) at 8 cents per shock of 8 hills square. We think the corn and oat chop at the price he names better than either the bran or middlings, and therefore suggest as follows for a ration:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. timothy hay	10.42	.34	5.21	.17
10 lbs. corn stover	5.95	.17	3.24	.07
8 lbs. corn and oats	8.12	71	4.22	.34
2 lbs. oil meal	1.82	.59	.65	.14
Totals	26.31	1.81	13.32	.72

INDOLENCE.

M. S. P., Cambridge, Vt., has a very choice yearling bull that is doing him no good. He says that he is not over fat and wants to know what remedy can be adopted to make him serviceable. We recommend that he give him plenty of exercise, and then give him a good diet in which the protein is largely represented. For this purpose nothing is better than a few oats in connection with good clover hay. If this does not bring him around all right we do not know what will. In the matter of exercise, now would be a good time to train this animal in harness before a cart or sled or a common stone-boat and make him useful in that way while giving him exercise; otherwise there is nothing better than the common tread power. Let him get into that, put on the brakes so that it will not go too fast and let him walk for an hour in the morning and an hour in the afternoon.

THE BABCOCK TEST.

At our creamery in town, where I am in the habit of selling some of my cream, which is bought by the Babcock test, they are in the habit of testing the cream once a month, for convenience, taking a sample of the cream every morning and keeping it until the end of the month, when they make their test, using a 17.6 pipette for measuring the cream into the test bottle. Is it correct to use a 17.6 pipette after the cream standing for a month, or should we use an 18 c. c. pipette?

On examining the test bottles at the creamery and also the ones I have myself, we find that we can take a pair of dividers and place them on 0 and 20 on one bottle and they will span from 0 to 22, or 0 to 18, or 0 to 17, etc., on others, and the same way on the milk bottles; place them on 0 and 6 on one bottle they will span from 0 to 6.2 or 6.8 or 7, etc. How is this to be accounted for? Are the bottles incorrect? If so, where or how can we get bottles that are correct, as I do not see how anyone can make correct test when the bottles are not graduated alike. W. S. J.

Idaho Falls, Idaho.

If the cream is properly cared for, a preservative used and not exposed to the air so that it will dry up, the use of the 17.6 c. c. pipette is correct. But no matter what kind of a pipette is used it will be necessary, if correct results are desired, to make a correction, according to the richness of the cream tested. Twenty per cent fat requires 0.25% to be added to the reading. Fifteen per cent 0.10%; and other creams in proportion. Below 10% of fat no correction is necessary.

The necks of the Babcock bottle are not always of the same diameter, as you will see by examination, and it of course follows that if the same amount of fat is put into the bottle, one with a narrow neck, the other with a wide neck, the narrow neck will show the longer column of fat, although the weight is the same in both cases.

The proper way to find if the bottles are accurate, is to make a test of a number with the same milk. The tests should read the same with a variation of not over 0.10%.

THE IMPORTANCE OF A YELLOW SKIN.

G. L. Adams, Wis., asks the above question and supplements it with the further inquiry: Would you reject an otherwise satisfactory young bull or heifer, if it had a nearly white skin?

We are very sure that we should not reject an animal on this ground alone. Many of the best animals have been notably deficient in the coloring matter in the ears and elsewhere. It is undoubtedly more or less of a defect, but we do not consider it in any sense a vital defect. It is believed that this yellow color is indicative of a tendency to give rich looking milk, containing a butter fat that needs little or no extra coloring matter to produce the much desired golden June tint.

CRUMBLY CHEESE.

I have some trouble with cheese crumbling. They are hard to press and then they will brake or crumble when cut, and seem to dry out on keeping very long. W. L. B.

Henrietta, Tex.

Crumbly cheese is caused by too much acid. Either the curd was not cooked high enough or was not stirred sufficiently after cooking, to get the whey out. The result is that the whey left in sours, and causes a dry crumbly cheese.

FOR HARD MILKING.

I have a cow that milks very hard in forward or front teats. Can you give me a remedy? T. O. S.

Washington, D. C.

Use a teat opener of some kind. The three cornered one frequently mentioned in the DAIRYMAN will be found a very practical instrument.

SAW DUST AND MANURE.

Will you please tell me whether saw dust from the saw mills when used as bedding is in any way disinfectant? Does it injure the manure or make it better? I have been told that it soured and spoiled the manure. I have had my first experience with abortion and thought it would help me to keep down disease germs. G. A. M.

Davenport, Iowa.

Saw dust is not a disinfectant in any way. It acts as an absorbent in taking up and saving the liquids of the manure and is valuable in that it forms a good bedding and so keeps the cows clean.

Its great objection is that if used in any amount it makes the manure so light and dry that it is liable to fire fang and thus injures the manure and causes loss of fertilizing ingredients. It may keep down disease germs by making the manure too dry for them to multiply, but not otherwise.

SCHMIDT CURE FOR MILK FEVER.

What is Schmidt cure for milk fever?

Oakhurst, Ga. J. M. B.

On page 976 of the current volume of the DAIRYMAN you will find an account of the method and the results of its use. As iodide of potash is used, it sometimes goes by that name as well as the Schmidt.

THE AIR CHURN.

Please give your opinion in regard to the inclosed circular of the air blast butter separator. I have a neighbor who intended to invest in one of them, but I advised him to leave it alone. C. A. L.

Moline, Ill.

You will find numerous references in the DAIRYMAN regarding air churns. We have stated many times that they are of no advantage over the usual box or barrel variety. See page 984 of the current volume.

ORDER OF FEEDING.

An eastern subscriber asks if it is better to feed grain after or before roughage. Also, which is the better way, to feed salt with grain, or put it where cows can get it any time they want it.

We apprehend that it makes very little difference, provided that grain is not fed in too concentrated a form. We prefer to give the salt each day with the feed. Others prefer to have it where the cattle can get it, and help themselves, as they seem to need.

AN INDEFINITE QUESTION.

Can you tell me what milk that tests 5%, churn test 16, will net per quart with cream at 65 cents per gallon (30% cream) and butter 25 cents per pound. S. L. G.

Lima, N. Y.

If our correspondent will be a little more explicit we will endeavor to answer his question. What is meant by "churn test 16."

A 400-POUND COW.

Please tell me what is meant by 400-pound cows? F. J. M.

Hingham, Wis.

This term means that the cow gives 400 pounds of butter during the year.

PRICE OF ELGIN BUTTER.

Will you kindly send me the Elgin price for butter for the past year 1899 for "extras?" Would like the average price for each month.

North Bend, Wis. J R. McD.

You can best obtain the information by applying to the Secretary of the Elgin Board of Trade.

WHITEWASHING WITHOUT BRUSH.

Can you inform me of any device for whitewashing the inside of stables that will do the work cheaper and quicker than with the brush? J. E. L.

Newport News, Va.

Whitewashing can be done cheaply and successfully by means of a spray pump and a Vermorel nozzle. The whitewash should be kept well stirred, free from lumps and not too thick.

ALFALFA.

Are there different varieties of alfalfa? If so, what variety would suit this section best? How would it do for dairy cows? Would it suit this climate? When should it be planted and how? In fact, would like to learn what I can about alfalfa and its uses and feed value. Several persons in this section are also interested in this. T. P.

Loudoun Co., Va.

There are some two or three varieties of alfalfa, but only one which is extensively raised. The Department of Agriculture has procured some seed of a variety from Turkestan, which promises to be exceptionally valuable, but this seed is not to be had in a commercial way, and for the present only the common variety is obtainable in any considerable amount. The Editor of this paper sent to Colorado for such.

There is no better crop grown for dairy cows than alfalfa. In fact, when fed with corn meal, it may be said to be an ideal ration.

Alfalfa, more than any other crop is particular as to the nature of the soil on which it grows. It will not grow on a thin soil, one that has a hard pan or one where the water stands near the surface. Underlying rocks, sour, marshy or stiff, clayey soils are fatal to its growth. A rich sandy soil is the most favorable. Standing water will quickly kill the plants.

The soil should be thoroughly prepared, subsoiled if necessary and made free from weeds or trash of all kinds. In the south, October and March are the best months. Sow the seed at the rate of 20 to 25 pounds per acre If the soil is free from weeds no nurse crop is required; otherwise oats can be sowed with the alfalfa, and the resulting crop cut when six to eight inches high. This will keep down the weeds and at the same time

"What's in a Name?"

Everything when you come to medicines. A sarsaparilla by any other name can never equal Hood's, because of the peculiar combination, proportion and process by which Hood's Sarsaparilla possesses merit peculiar to itself, and by which it cures when all other medicines fail. Cures scrofula, salt rheum, dyspepsia, catarrh, rheumatism, loss of appetite and that tired feeling.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Young Girls

How easy it is for young girls to go into the "decline." They eat less and less, become paler and paler and can hardly drag through the day. They are on the steady downward course. Iron does them no good; strychnine and bitters all fail. They need a food that will nourish them better, and a medicine that will correct their disease.

Scott's Emulsion

is both of these, elegantly and permanently combined. The Cod-Liver Oil makes the blood richer, and this gives better color to the face. The hypophosphites of lime and soda act as a strong tonic to the nerves. Soon the weight increases, the digestion improves and health returns.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

be cut early enough to prevent any damage to the young altalfa plants, which are very delicate when young.

CONVICTION OF MILK ADULTERATION BY ANALYSIS.

Will you through the columns of your paper, tell me, is a man ever convicted of watering his milk on the chemical analysis alone, without other proof? If so, when was it? H. A. W.

Jefferson Co., N. Y.

A majority of the cases where men are convicted and fined for adulterating milk by watering, etc., are decided on the testimony of the chemist's analysis of the milk. In your own state of New York, few if any cases are decided in any other manner than by the analysis.

DEEP AND SHALLOW PLOWING.

Would you advise deep or shallow tilling of the soil as a rule? And please give reason for your answer. H. S.

Little Valley, N. Y.

There is no one rule for plowing that will apply to all kinds of soil (nor year after year on any one soil.) If a light, deep mold is to be plowed, one that contains an abundance of stored up fertility and good under drainage, then a very shallow furrow will be found sufficient. If, on the other hand, the soil is a heavy, tenacious clay, deep, heavy furrows are turned so as to bring the under soil to the action of light, air and frost, thus rendering the soil more friable and easily worked; also to get the advantage of the action of the nitrifying organisms. If the soil is a light loam with a heavy, water-tight subsoil, deep plowing is necessary to break up the subsoil, and allow the rain water to percolate through the upper layers and thus prevent accumulation of water in the upper layers; but, on the other hand, the bringing to the surface of an infertile clay by deep plowing, will frequently seriously damage the fertility of the surface soil. There are too many varying conditions of soil to enable one to say that either deep or shallow plowing is preferable. The farmer must adapt his methods to the quality of his soil, and plow accordingly.

FOR KILLING LICE.

Please give through your paper your remedy for lice on calves. DR. J. K. W.

Galena, Kan.

The following is well recommended:

One ounce carbolic acid, one quart fish oil, one quart crude petroleum. Mix and put on with a brush, or better still, with an atomizer.

If you want to use something that you will not have to mix up yourself, consult the advertising columns of the DAIRYMAN.

TO CURE CALF SCOURS.

J. W. M., Aledo, Ill., sends the following as an infallible cure for this troublesome malady:

One quart of beans and two of water; boil for half an hour; turn water off and give about a pint of it at a dose, and then, if necessary, repeat in five or six hours.

I have used this for fourteen years, and it has never failed me; and it is worth $10 to anybody that is raising calves by hand.

SILO QUESTIONS.

I have about decided to build me a silo and would be very much obliged to you for information on the subject. I would like to build a stave silo with a capacity for holding enough silage to run from twenty-five to thirty cows.

I have no idea how much material to buy or what kind to use. Please give me explicit directions how to build, etc. If you know of anything that will stop a cow from self sucking you will greatly oblige me if you will give me the recipe. T. A. M. D.

New Providence, Tenn.

Thirty cows will eat about 108 tons of silage in six months. This will require a stave silo 17 feet in diameter by 26 feet deep. We have given the detailed directions for building, frequently during the past year and cannot again spare the space to repeat it. You can obtain detailed instructions on this subject by writing to the Pennsylvania and Cornell Experiment Stations for their bulletins on "Silo Building." If you require detailed instructions on growing and harvesting and filling the silo, we should advise you to obtain Woll's "Book of the Silo." It can be obtained at this office for $1.00 postpaid.

Harvey's Anti-sucking bit is well spoken of; a canvass bag for enclosing the udder is used by some and a decoction of quassia chips, sponged on the teats and allowed to dry, has been recommended. If the quassia is used the udder must be washed before milking.

NERVE FORCE.

In dairy cattle as in race horses, it has become an established fact that large performance is greatly due, not only to large capacity in structural conformation, but also to the supply of nerve force with which the animal is endowed. This is also true of men and women. It becomes important then in the judging of dairy cattle that close observation be had of the evidences of this quality. Speaking of this "nerve force," a writer in the *American Horse Breeder*, of Dec. 26, says:

"Nerve force is the name used to denote that invisible mysterious agent by which the muscles are caused to contract, thus causing the machinery or framework of the animal to move.

Speed is the result of applied power, and nerve force is the power which produces it in the runner, the trotter and the pacer.

Nerve force bears the same relation to the horse as steam does to the engine. It varies greatly in different individuals of the same family, and also in the different offspring of the same parents. It is the bed rock of speed and the mainspring of the organs of locomotion. Everything else *being equal, the trotter or runner or pacer which has the most nerve force and the greatest capacity for generating it*, will show the most speed and endurance.

When the nerve force is partially exhausted, the animal must slacken his speed, and when completely exhausted must stop just as surely as the machinery of the engine must stop when the steam is exhausted, or the wheels of the time-piece cease to move when the mainspring is fully uncoiled."

The wise and skillful dairyman applies this same doctrine in breeding for nerve force in his cattle; in so balancing his ration as to support and generate it; and in so handling his cattle as to conduce to its maintenance, that it may not be exhausted by undue exposure, bad usage, or unnecessary excitement, but may be applied wholly in the direction where lies his best profit. The same law is found with the dairy cow as with the horse bred for speed.

An Up-to-Date Wisconsin Dairyman.

Good Ideas Put in Practice.

ED. HOARD'S DAIRYMAN:—Kindly give me a balanced ration from the following feeds, of which I have a good supply:

Good clover hay, No. 1 silage, whole dry corn fodder, oats, wheat and barley straw; of grain, oats that contain one-fifth of wheat and weigh 90 lbs. per sack, and barley.

Cows are grade Jerseys and weigh from 700 to 1,100 lbs.

Have been feeding as follows: In barn, silage 25 lbs. per day, in two feeds; all the clover hay they will eat clean, from 6 to 10 lbs. of ground oats and barley, about one-half of each once a day. The large cows get more than the small ones. They are kept in barn in Bidwell stalls till 11 a. m., then are turned out in yard, to water from a flowing well. They get all the dry corn fodder they will eat, and have run to straw stacks, and are put in barn at 3 p. m. If cold are put in sooner.

I was going to sell barley and buy bran, but could only get 30 cents per bushel, being colored some, and bran is $15 per ton; so I tried bran and oats for a week, and then the barley, and the results were just as good from the barley so I continued with barley. This is the first barley I ever fed to dairy cows. They are doing well, being milked since last of August and first of September. I have practiced winter dairying for 10 years and find it pays best, with a good warm barn and a good lot of silage.

I get the full benefit of fall feed and again in spring from grass, and also the prices for dairy products are better, but I would say right here if I should give up my silo, then I would give up winter dairying. It is a mystery to me that no more silos are in use; have used mine for 8 years with good success.

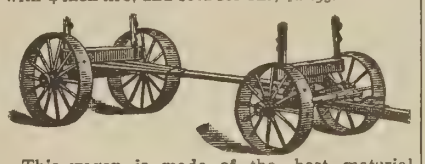
My silage corn this year had a good ear to every stalk.

Kindly let me know through your paper, if it will pay for me to buy bran and oil meal, and add to my daily ration. I have in former years, fed lots of bran, also oil meal.

It seems to me if we can raise our feed as near to a balanced ration as possible it is our gain. J. J. MENN.

Norwalk, Wis.

We print the foregoing letter in full as an encouragement to others to follow similar methods.



Not counting the corn stover or straw cows are receiving, our formula is as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.32	4.20	.18
10 lbs. clover hay	8 47	.68	3.58	.17
4 lbs. oats	3.56	.37	1.49	.17
4 lbs. barley	3.56	.35	2.62	.06
Totals	22.19	1.73	11.89	.58

Ordinarily we should count this low in digestible protein, but with the record of the cows at the Wisconsin Agricultural Experiment Station, we cannot be too positive on this point. We hope to have more definite information from there soon, and shall then be prepared to speak more positively in this regard. If it should be thought advisable to add anything to the above ration it would seem to us that nothing would fit in better than a little old process oil meal as that would raise both the protein and fat.

Farm Wagon only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmers Handy Wagon that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

Cornish, Curtis & Greene Mfg. Co.,

GENERAL SALES AGENTS. **Fort Atkinson, Wis.**

SOME of Judge Hanecy's friends are making the claim that while his decision in the oleomargarine cases was a foul blow to the dairy interests of that state, there is abundant compensation in that the beef interests were correspondingly benefited and should therefore rally to his support A weaker or more fallacious theory could not be advanced. Just as surely as the price of wool affects the price of mutton, just so certainly does the price of butter regulate the price of beef. With butter at 15 cents per pound, every stockman in the land will turn his energies to producing beef and the supply overtakes the demand, with a resulting slump in prices.

WISCONSIN CHEESE MAKERS' ASSOCIATION.

The cheese makers of Wisconsin will hold their 8th annual meeting in the Assembly Chamber, at Madison, Feb. 7,8 and 9, 1900, for which Secretary Baer has issued a program, which cannot fail of being instructively interesting to any cheese maker in the state.

We give below the titles of papers:

WEDNESDAY, FEB. 7.

2 P. M.—Address of Welcome, Response and General Greetings.

7:30 P. M.—President's Annual Address, J. A. Carswell: The Common Interests of Cheese Maker and Patron, A. J. Glover, St. Paul, Minn.; Report of Officers.

THURSDAY, FEB. 8.

9 A.M.—Cheese Makers Class, eight lessons, each limited to five minutes as follows: Receiving Milk at the Weigh-room, John McCready, Dairy School; Preparing Starters and Ripening the Milk, Aksel Bruhn, Plain; Setting, Cutting and Cooking of the Vat, Hugh Nesbit, Woodstock; Drawing of the Whey and Handling of the Curds on the Racks, Julius Berg, Dairy School; Milling or Grinding and Salting the Curd, Walter Fero, Muscoda; Pressing and Bandaging Cheese, F. N. Sargent, New Lisbon; Curing of Cheese, A. C. Wirth, Neenah; Boxing and Shipping, F. O. Vierguty, Marion.

2 P. M.—Remarks on Swiss, Brick and Limburger cheese, J. H. Monrad, Illinois; The Importance of Raising the Standard of Wisconsin Cheese, J. D. Cannon, Dale; The Proper Care of Whey, H. F. Thiel, Snow; Benefits and Help of the Wisconsin Curd Test in Brick Cheese Making, J. F. Bochman, Bonduel. Discussion: What is a good cheese?

7:30 P. M.—Address, Gov. Scofield; The Influence of Temperature and Moisture upon the Composition of Cheese, Dr. L. L. Van Slyde, New York.

FRIDAY, FEB. 9.

9 A. M.—The Benefits of the Call Board, M. Mc Kinnan, Sheboygan Falls; Flies, J. F. Steinwood, Colby; The Feeding Value of Whey, William O'Brien, Mt. Ida; Care of Delivery Cans and Cheese Factory Apparatus, J. W. Cross, Mauston.

The sum of $125 will be awarded in prizes on the excess pro-rata plan to entries, scoring 90 or more points.

For further particulars address the Secretary, Mr. U. S. Baer, Experiment Station, Madison, Wisconsin.

The Wife Writes.

ED. HOARD'S DAIRYMAN:—Enclosed you will find one dollar to renew my paper for another year. I have found much to learn and I have made my husband to buy a fine Jersey bull. We had a grade before and all these heifers have done very well. But I can't get any farmers round here to take a dairy paper; they know everything, and just the same leave their cattle out-of-doors in cold and storm and set themselves to the warm stove and howl about bad times and smile at us if we take care of our animals. We are milking 8 cows; two of them are due to calve by Feb. 1st. We ship 2 8-gallon cans of milk every day, and every 4 days 3 cans. Milk tests, 3.9 to 4%. We are feeding brewers grains, wet, 25 lbs. per cow and 5 lbs. of middlings, corn fodder with ears, stover and marsh hay.

Please tell me in your paper what improvements I should make for more milk. As my husband can't read English and I am only 7 years in this country, never went to school, only learned by myself, so you will not mind my bad writing. We have found our Jersey bull in your paper.

Please tell me how much butter a cow will make giving 40 lbs. milk a day, test 4%, for 8 months; for 3 months she gives less. In all she gives 11,050 lbs. of milk, a grade Jersey, for 1 year. MRS. L. RUPPRECHT.

Waukesha Co., Wis.

The foregoing communication is printed as it was written, and while there are some expressions that are a little out of the ordinary it shows that Mrs. Rupprecht has been an apt scholar in the English language as well as in the science and art of dairying.

If these cows are receiving about 10 lbs. of corn fodder, 6 to 8 lbs. of corn stover, 6 lbs. of marsh hay in addition to the 25 lbs. wet grains and 5 lbs. of middlings they are being fed a fairly well balanced ration. The only modification that we could suggest would be that 2 lbs. of gluten feed might be substituted for the same quantity of middlings. This would increase the protein somewhat, and probably result in a moderate increase in the flow of milk.

A cow giving 11,050 lbs. of milk in one year with an average test of 4% fat, is capable of making 515⅔ lbs. of butter, provided the loss in creaming and churning is reduced to the lowest point. Such butter will be up to the commercial standards in its content of pure fat.

Breeding from Immature Animals.

ED. HOARD'S DAIRYMAN:—It is an accepted fact that the successful operation of any large machine depends upon the proper mechanism and adjustment of each part making up the intricate whole. Like an engine with a fly wheel that is not perfectly balanced, so the animal organization of faulty proportions is only able to perform its work to a moderate extent. The defective parts of such an animal, when taxed to its full capacity, become a source of danger that involves the entire system.

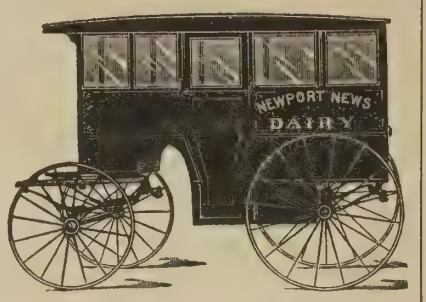
Offspring of very young animals with an immature system, or one that is imperfectly developed, inherit this condition and are thus predisposed to the evils arising from the lack of strength and constitutional vigor. Such effects are not always apparent in a single generation, but if the practice of breeding from immature animals is continued for successive generations, unfavorable results are liable to be produced.

Any student of live stock breeding will find in the history of the same, ample evidence to support the above fact. Also note the influence of too early breeding in the developement of young heifers.

In face of these facts, how universal is the demand for young bulls. A breeder with a mature bull for sale seems forced to dispose of him at a low figure, or sell him for beef. Is not this a mistake? Undoubtedly all who read this can recall the name of some dairy-bred bull who was disposed of when from three to five years of age because he was an old bull or because the breeder had many of his calves, and yet later as these calves develope and prove of value, the breeder was first aware of the bull's value as a sire. It is not the mistake of an individual breeder that prompts us to call attention to this fact, but it is a realization of the effect which the aggregation of such practices produce that we most fear. Their effect on the breed in general must be of considerable importance.

Let us hope that during the 20th. century, now opening, we may expect to see a better appreciation of the value of good sires and the hope that their years of usefulness will be extended and their value meet with greater favor in the market.

Peterboro N. H. Wm. H. CALDWELL.



Can Eat Any Kind of Food.

SINCE SHE LEFT OFF COFFEE AND USES POSTUM FOOD COFFEE.

"Coffee caused dull headaches and dizziness, with steady indigestion, until I discovered the reason of the trouble, and this was proven by leaving off coffee and taking Postum Food Coffee. The dizziness, headache and indigestion have entirely disappeared.

"My mother, Mrs. Burlingame, Kenilworth, O., was a great sufferer from stomach trouble and indigestion for many years. She had to live on a very restricted diet, until during the past winter she gave up coffee and began using Postum Food Coffee every day. It is now three months since she made the change, and she is so much improved she can eat nearly any kind of food. It is evidence to us that the coffee caused the trouble and that the Postum Food Coffee helped to build her back into health and strength." Mrs. J. M. Gould, W. Farmington, O.

Mention HOARD'S DAIRYMAN when writing.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 13,560 pounds. There were no bids and no sales. The Quotation Committee announced the market firm at 24 cents. The annual report of Secretary Taylor for 1899 was read. It shows that during the year 43,610,507 pounds of butter sold for $9,027,374.95, and 6,104,725 pounds of cheese for $518,901.63, the total sales being $9,546,276.58.

During the twenty-eight years of its existence 454,042,849 pounds of butter were sold and 176,543,569 pounds of cheese, the total value af which was $116,047,742 14.

The average price for butter in 1898 was 18 4-5 cents; in 1899 20 7-10 cents; and for twenty-eight years 26⅞ cents.

Cheese averaged 8½ cents during the year just closed, 7¼ cents during 1898, and 7¾ cents for the twenty-eight years.

The sales during 1899, by months, were as follows:

	Pounds Butter.	*Pounds Cheese.*
January	3,080,526	634,857
February	2,932,523	699,204
March	3,330,051	655,711
April	3,458,595	523,259
May	4,547,200	481,066
June	5,358,116	419 960
July	4,626,077	300,789
August	3,909,915	296,586
September	3,503,488	416,861
October	3,017,772	511 128
November	2 957,372	550,907
December	2,888,862	644,397
Totals	43,610,507	6,104,725

There are 467 factories represented with a total membership of 271.

The increase in the sales of butter is about one-half a million pounds over 1898. There has been a slight decrease in the production of cheese, but prices of both have been higher than in 1898.

The sales of butter for the corresponding week of the three preceding years were as follows:

Jan. 30, '99, 4,200 lbs. of butter sold at 18½ c ts.
Jan. 31, '98, 11,010 lbs. of butter sold at 19 cts.
Feb. 1, '97, 34,560 lbs. of butter sold at 20⅛@20¾c.

The New York market Monday was reported steady at 25 cents. H. C. B.

Elgin, Ill., Jan. 29.

DAIRY MARKETS.

ELGIN, Ill., Jan. 20.—Although no butter was sold the quotation committee made the market firm at 24c the same as last week. Offerings were 266 tubs, no bid being made. Butter one year ago, 18¾c. Sales reported for the week, 9,800 tubs.

CHICAGO, Ill., Jan. 29,—Butter—Quiet. Easy. Creamery extras, 24c; firsts, 22@23c; seconds, 19@20c; imitation creameries. fresh, from unsalted butter, 18@20c; dairies, extra (Cooley's), 22c; firsts, 20c; seconds, 18c; ladles, 17@17½c.

Cheese—Firm. Full cream Cheddars, 11@12½c per lb; Twins, 11¼@12½c; Young Americas, 12@12½c; Swiss, 12¼@12½; Limburger, 10½@10¾c; Brick, 10½@11c.

Eggs.—Steady. Strictly fresh per doz. cases returned, loss off, 14c; held stock, 8@10c; ice-house, 5@9½c; seconds, $1@1.80 per case; checks, $1 per case.

Bran—Firm at $12.50 per ton. Offerings very light.

Cattle—Native beef cattle, barring some of the choicest light and heavy weights, were generally 5@10c lower, with the late market especially weak on short-fed stock averaging 1,300@1,550 lbs. Steers averaging 831@1,650 lbs. sold at $4@6.25; bulk, $4.75@5.50. The quality was poorer than usual, a good many 1,300@1,500 lb. unfinished steers selling at $5@5.35. The cattle at $6.05@6.25 averaged only 1,380@1,382 lbs. Common 1,000@1,160-lb. steers sold at $4@4.40, with choice 960-lb. yearlings at $4.80, and "handy" 1,120-lb. steers at $5 30. Corn-fed Westerns sold at $4.40@5.80; bulk, $5.25@5.50. About 1,000 straight Texas sold actively at strong prices, three loads averaging 1,252@1,451 lbs. selling at $5@5 20, and the balance at $3 75@4.80; bulk $4.75@4.80. About 500 Illinois and Missouri Texans averaging 877@1,138 lbs. sold at $4.25@4.95. Native butcher stock ruled strong with sales largely at $3@4.25. Feeding cattle ruled firm at $3.50@4.80; bulk, $4.25@4.50

MILWAUKEE, Wis. Jan. 29.—Butter—Creamery, fancy prints per lb., 25c; extras, 24c; firsts, 20c; seconds, 18c; roll, 15@16c; dairy selections, 19@20c; lines, 15@16c. Business continues only moderately active, but prices are held firmly; receipts, 8,795 lbs.

Cheese—American full cream, October flats, 12½@13c; November, 11@11½c; Brick, 10@10½; Limburger, 10¼@11c; Swiss, drum, 12½@13c; block 13@13½c; No. 2, 10½@11c. The market is steady; receipts, 2,000 lbs.

Eggs—Fresh, per doz., 15c, loss off, cases returned; held, 10@11c; cold storage, 9@10c; seconds, 5@6c as to quality. The market is more active and prices are held firmly; the cold weather having stimulated the demand; receipts, 60 cases.

SBEYBOYGAN FALLS, Wis., Jan. 24—Six factories offered 269 boxes of cheese in the call board to-day, and the sales were made as follows: 36 cases Young Americas at 12c, 55 at 11⅞c 60 at 11¾c and 40 Longhorns at 12½c. One lot of 55 white Young Americas passed a bid of 11⅛c and 23 twins passed a bid of 10¾c. Six buyers were present and the market was active. Adjourned to Feb. 7.

NEW YORK, Jan. 29.—Butter—Creamery; Western extras, 25c; firsts, 23½@24c state extras, 24½@25c; firsts, 23½@24c.

Cheese—State, full cream, large or small, fall-made, fancy, 12½@13c.

Eggs—State, Pennsylvania and Western, 17c.

BALTIMORE, Md, Jan. 29.—Butter—Market steady; creamery separator, extra, 27@28c; extra first, 25@26c; creamery first, 25c; creamery imitation extra, 24c; Iowa and Northwestern ladle, extra, 21@22c; extra first, 20@21c; firsts, 20c; Western, store-packed, 16@18c; creamery rolls (2 lbs.) 27@28c.

Eggs—Market steady; strictly fresh stock. 19c.

PHILADELPHIA, Pa., Jan. 25—Butter—Solid, packed, separator creamery, extra, 25c; firsts, 24c; seconds, 21@22c; imitation creamery, extra, 22c; firsts, 21c; seconds, 20c; ladle-packed extra, 21c; firsts 20c; seconds, 18c. Print Butter—Creamery extra, 25c; firsts, 24c; seconds, 22c.

Eggs—Pennsylvania and nearby, 19c; Western, 19c: Southwestern and Southern, 18c.

BOSTON, Jan. 29—Butter—Creamery extra, 26c; western, extra, 25c; dairy extra, 23½c; imitation creamery, 21c; Western ladle, 20c; print creamery, 27c; box creamery, 26c.

Eggs—Fancy nearby, 24@25c; choice fresh, 21c; Michigan extra, 20c; Western, 19c; fair to good, 15@17c.

ST. LOUIS, Jan. 29—Butter—Steady; creamery, 20@25c; dairy, 16@20c.

Eggs—Steady; 13½c.

KANSAS CITY, Mo., Jan. 29—Butter—Creamery, 20@23c; dairy, 18c.

Eggs—Fresh, 11½c.

CINCINNATI, Ohio, Jan. 29—Butter—Quiet; 25c.

Cheese—Steady; good to prime Ohio Flat, 12½c.

Eggs—Firm, 16c.

NEWARK, N. J., Jan. 29—Market quiet; 25c for fancy creamery. Receipts a little more liberal.

NEW ORLEANS, La., Jan. 29—Butter—Market quiet; Elgin 25¼@26c.

Eggs—Storage eggs, 10c; fresh, 13c. Weather cold.

BALTIMORE MARKET.

BALTIMORE, Jan. 25—Butter—There is a manifest disposition on the part of all who are concerned in the production and distribution of butter, to encourage, for the time being, a settlement of value upon the basis now current. At the decline noted in last report, the market is firm, and while as large amount of business is being done, there is a healthy relation established between supply and demand. We hear little complaint of quality in marks of creamery coming forward that are usually fine, although buyers are critical, and the prices current are still high enough to make them cautious Choice gathered cream stock, the kind that at all times commands the favor of buyers, continues in very limited supply and the favorite marks would meet with a cordial reception at our full quotations Imitation creamery is in very moderate receipt, and is not in request unless of exceptionally fine quality. There is little or no accumulation of ladle packed butter, current receipts having goue into the usual channels in volume about equal to the supply. Roll butter while in moderate receipt, is quite sufficient for the demand. Store-packed, at prices now ruling, finds ready customers, and baking stock is scarce.

Creamery Separator, extras, 26c; firsts, 24@25c; seconds, 22@23c. Creamery Gathered Cream, extras, 24@25c; firsts, 23@24c; second, 21@22c. Creamery Ohio, extras, 24@25c; firsts, 23@24c; seconds, 21@22c. Creamery Imitation, extras, 22c; firsts, 21c: seconds, 19@20c. Iowa & N. W. Ladle, extras, 20c; firsts, 18@19c; seconds, 17c. Ohio & Indiana Ladle, extras, 19@20c; firsts, 18c; seconds. 16@17c. Ohio Rolls, extras, 18c; firsts, 17c; seconds, 15@16c. W. Va. Rolls, extras, 17c; firsts, 16c; seconds, 15c. Ohio & W. Va. Storep'd, extras, 15@ 6c; firsts, 14c; seconds, 13c. Creamery Blocks (2lb), extra, 27c; firsts, 26c; seconds, 22@23c. Creamery Prints (½lb.), extras, 27@28c; firsts, 25@26c; seconds, 23@24c. Md., Va. & Penna. Prints, extras, 23@24c; firsts, 22c; seconds, 21@22c.

Cheese—Receipts are ample for the demand; market firm at unchanged prices.

N. Y. State—Cheddars, fine 12¾@13c; choice, 12¼@12½c; fair, 11½@11¾c. Flats, fine, 13c; choice, 12½@12¾c; fair, 12@12¼c. Small, fine 13¼@13½c; choice. 13c; fair, 12½c. Ohio—Flats, fine, 12½@12¾c; choice, 12¼@12½c; fair, 11½@12c. Picnic, fine, 13@13¼c; choice, 12½@12¾c; fair, 11½@12¼c. Swiss Cheese, fine, 12@12½c; choice, 11¾@11¾c; fair, 10½@11c.

Eggs—So far this week the receipts of fresh eggs have been rather light and with a good demand, at 19 cents Our market at the present time is quite bare of stock; we advise liberal shipments, as our market is in good shape.

301 Exchange Place. G. M. LAMB & BRO.

NEW YORK MARKET.

NEW YORK, Jan. 27—Butter—Receipts for the week, 30,601 packages. Exports for the week, 19 packages.

Our market was barely steady on extra fresh creamery at 25c; there is more of this style of butter arriving than the trade anticipated and some receivers having a surplus were willing to shade the price ½c to get quit of stock. At the close weather is more wintry, stocks are light and there is a trifle firmer feeling on top qualities. Imitation creamery and all grades of ladle butter are more plentiful, in limited demand and lower prices.

Finest fresh New York state dairy sold at 23@24c but bulk of the arrivals were of poor wintry make and sold at 18@22c. June creamery was in light demand hardly enough selling to make a price; best qualities held at 23c and some small sales are reported at this price, but to sell any considerable lots much lower prices would have to be accepted. We quote:

Creamery, fresh, extra, 25c; medium, 24@24½c; poor, 22@23c. Dairy, extra, 23@24c; medium, 20@22c; poor, 17@19c. Ladle, extra, 20@21c; medium, 18@19c; poor, 16@17c.

Cheese—Receipts for the week, 11,327 boxes. Exports for the week, 13,359 boxes.

Exporters were in the market this week and bought some parcels of fine full cream cheese at 11¾@12c, but they confined most of their purchases to under grades full cream at 10@11c and skims of good quality at 8@9½c.

Home trade was very quiet, most of the inquiry being for late make full cream at 11@11½c, and few lots of finest small cheese were reported as sold at 12@ 2¾c. Quotations in the market have been fully ½c pound higher than actual sales and we reduce our quotations to conform with the actual conditions. We quote:

Full cream, small, extra, 12¼c; medium, 11¼@11¾c; poor, 10¾@11c. Full cream, large, extra, 12c; medium, 11@11½c; poor, 10¾@11 c. Part skimmed, extra, 10½@11c; medium, 9@10c; poor, 6@8c. Skimmed cheese, poor, 3@6c.

Eggs—Receipts for the week, 53,185 cases.

The market has been on the down turn all the week and at the close 17c is the top for the finest fresh gathered stock. The large quantity of refrigerator eggs offering in this market at prices ranging from 50c to $2.50 per case has completely demoralized the trade and there will be no relief to this market until the heavy stock of poor to good eggs are disposed of and out of the way. We note sales of 6 to 7 000 cases eggs for export to Great Britain at prices not transpired We quote:

New York and Pennsylvania, strictly fresh per doz., 17½@18c; Northern and Western, strictly fresh, 17c; refrigerator stock, 5@12c: limed, 10@12½c. DAVID W. LEWIS & Co.

177 Chambers St.

LIVERPOOL, Jan. 29—Butter—Finest United States and good, nominal.

Cheese—American finest white, 57s. American finest colored, 59s.

Latest quotations for fancy creamery: Buffalo, 26c; St. Paul, 23½c; Minneapolis, 23½c; Detroit, 24c.

WHAT SAY YOU?

There is nothing like a good beginning. Why not start the new year right as to separators anyway? Why try to get along with that old "hollow-bowl" machine any longer? You know in your own mind that you have got to change to an "Alpha" disc machine in near future—that you can't afford to go on with anything else and that your patrons won't stand it. You know that you and your patrons are conjointly losing just so many hard-earned dollars and cents every day you go on with the old machine. Why not put a stop to it? Why not put a stop to it now? It must come. Why not do the thing and have it done with?

Can you apply this course of reasoning to your creamery conditions—whether you have one "hollow-bowl" machine left or a dozen—and resist the conclusion suggested? Can any creameryman as a common sense business man do so?

Start the new year right. Put an up-to-date "Alpha" disc machine in the place of every "hollow-bowl" one left and you can never for an instant regret the step taken. You can't help effect a material saving from the moment you make the change and by July 1st every new "Alpha" machine will beyond doubt have saved its cost to you.

If you have the slightest doubt as to this we stand ready to demonstrate it to your own satisfaction. Can WE say more—can WE do more?

What say YOU?

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Ayrshire Calves For Sale from the Choconut Valley Herd. P. BYRNE, St Joseph, Pa. 51-2

For Sale—Shetland stallion, Pilot No. 884, dark bay, heavy mane and tail, 45 inches high. Foaled May 20th, 1888. Drives single and double; very gentle. The first check for $100 will catch him. JAS. DRIVER, Darlington, Wis. 51-4

For a desirable creamery location inquire of H. H. SMITH, New Richmond, Wis. 51-3

Wanted—A skilled butter maker, either married or single, as working foreman on a 100 acre A. J. C. C. dairy farm within twenty-five miles of Philadelphia. Must be a total abstainer and have good reference. Address W. M. B., Room 1310, Land Title Building, Philadelphia, Pa. 51-2

For Sale—Very cheap, in perfect order, combined churn and worker, cream vats, tester, etc., etc., for dairy or small creamery. L. D. PASSANO, Jr., Box 251, Warrenton, Va. 51-2

Wanted—On farm near Chicago, young married man to take charge of dairy herd of six cows. Must be a first-class butter maker, and able to raise poultry. Butter and poultry all for owner's family use. Splendid farm house, good garden, fuel and reasonable wages go with the place. Address, giving experience in dairy work and references as to character and ability, B. W. S., No. 1443 Marquette Bldg., Chicago, Ill.

I want for year or longer, first-class working foreman on stock farm near Chicago. Give age, experience, family, where been employed, wages received, etc. C. H. BUNKER, 136 Monroe St., Chicago. 51-2

Wanted—Location for creamery. For further particulars address, No. 302 Commercial St., Neenah, Wis. 51-2

Wanted—A first-class tenant for a first-class dairy and general purpose farm of 120 acres. Apply immediately. C. E. WARNER, Windsor, Dane Co., Wis. 51-2

Jersey Bulls For Sale—Ready for service; eligible to registry. Address, T. C. RUMPF, Fort Atkinson, Wis. 51-tf

Wanted—Position by an experienced butter maker. Best of references from last employer. Address J. R. WEIR, Le Roy, N. Y. 51-4

For Sale—A cheese factory in good dairy district. Received for season of 1899, 859,465 lbs. milk. Also a general store run in connection, goods invoicing about $800.00. Satisfactory reason for selling. Full particulars by addressing P. M. at Lawrenceville, Wis. 51-2

Creamery Plant For Sale—Line of three creameries in Dane Co., Wisconsin, all in first-class shape, latest improvements, etc., doing a good business. Satisfactory reason for selling. To the right party will sell on favorable terms. For particulars apply to M. L. BROWN & CO., 141 So. Water St., Chicago, Ills. 50-tf

Correspondence solicted with parties having capital to invest in private creamery. 230 cows pledged within radius of four miles; more to come as soon as creamery starts. Splendid dairy country. Five miles to R. R. station. Address, J. M. MOE, Chetek, Wis. 50-3

The undersigned wishes to arrange for a regular shipment of four cans of high grade milk with some dairyman near Milwaukee. Address, P. J GROGAN, 2611 Sycamore St., Milwaukee, Wis. 50-3

For Sale—Twenty-five high grade Jersey cows, thirty-five one and two-year-old heifers, by St. Helier's Cowboy 44822. For particulars address, HUMPHREY BROS, Fairmont, Kansas. 50-4

For Sale—One large Turbine De Laval separator and two twin cream vats, capacity 200 gals. each. Are in good condition. Address, LANCASTER CREAMERY CO., Lancaster, Pa. 48-4

For Sale—De Kol Bulls. Officially tested dams. Send for catalogue. M. S. CAMPBELL, Genoa, Ill. 49-10

For Sale—Pure bred Tamworth pigs ready to wean. Also a few Holstein bull calves. GLIEDT & KAISER. Freistatt, Mo. 48-6

Wanted—To rent, a creamery in a good locality with a good run of milk. Prefer one fully equipped. Address LOCK BOX 45, Lake Mills, Wis. 48-4

Wanted—Farm manager. A man capable of managing a farm of over five hundred acres, with dairy of 200 registered Jersey cows. Must thoroughly understand care of stock and handling of labor. None but competent, energetic man, able to give best of references, need apply. Address, B. E. W., P. O. Box 520, Philadelphia, Pa. 50-2

Wanted Now—A strong, able and sober married or single man to work by the year on farm in Illinois. Must be good milker. For further particulars address A. J. DAUGHERITY, Streator, Ill. 46-tf

For Sale—Dairy and outfit. Terms easy. R. A. LAMBERT & SON, Mobile, Ala. 46-tf

Buttermaker of 9 years' experience wants a steady position. Married. Will furnish good references. Work guaranteed. State wages. Address J. R., care HOARD'S DAIRYMAN. 46-tf

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman 45-tf

Proceedings of the 19th Annual Meeting Connecticut Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The nineteenth annual meeting of the Connecticut Dairymen's Association was held at Hartford, Jan. 17 and 18. The prominent features of the meeting were the large attendance, the excellence of the program, the close attention accorded the speakers and the large exhibit of dairy products.

Mr. S. A. Gilbert, North Greene, Me., spoke on "The creamery, Its Duties and Obligations." He made a strong plea for the farmers' interest in associated creamery work, advocating associated in place of proprietary creameries. Managers erred in scrambling for milk by attempting to divert it from other creameries instead of enlarging the regular supply. More small creameries should be operated in New England, as it is not necessary to do a large business to do it at a small cost, because long hauls impair quality of cream, thereby offsetting advantages gained by large operations.

In the discussion which followed, Maj. Alvord, of the Dairy Department at Washington, D. C., maintained that cream, obtained from good milk, properly handled, could he hauled long distances without impairing its quality, and emphatically advocated large creameries. Creameries should rather be consolidated in order to accomplish this, instead of developing more small creameries.

The Turner creamery with which Mr. Gilbert is connected, gathers Cooley cream and passes it through a separator to more effectually consolidate the cream, whereby the churning can be made at a lower temperature. Low temperature admits more exhaustive churning, less butter fat going with the buttermilk. All the cream is pasteurized. Commercial starters were preferred as the product was more uniform than when home starters are used.

"The Profitable Cow" was discussed by C. L. Beach, dairy instructor at the Connecticut Agricultural College. He illustrated his talk with a table of records of the College herd, and with drawings of cows to show the desired points of dairy animals; of the twenty-five cows in the herd, sixteen were kept at a profit, four barely sustained themselves, and five were maintained at a loss. The variation in the herd ran from a profit of $42 to a loss of $18. Too much attention is devoted to breed instead of individuality. The address was a very logical exposition of the danger of banking on the breed of cows, rather than individual capacity for production.

Samuel Currie, from Euclid, Minnesota, spoke on "How to Meet Competition." He pointed out that while the superior quality of many of our products was acknowledged in the markets of the world, we failed to command the respect of nations, as dairymen. This deplorable fact was due to the sale of fraudulent dairy products, whereby our reputation was sacrificed. This was proved by Maj. Alvord's report, which plainly shows that our butter is better than our foreign reputation. The way for Connecticut dairymen to meet western competition lies in a better machine,—cows of greater economical production. "The competition of cow with cow is bound to be the future battle ground of dairy supremacy."

Major Alvord explained the menace of the butter industry by process or renovated butter. He briefly described the preparation of this product and recounted how efforts of the Department of Agriculture to open a foreign market for our butter had been seriously effected by the acts of unscrupulous dealers in sending process butter abroad. Such treacherous proceedings could be stopped by government inspection, classification and branding of all dairy products offered for export, similar to the inspection now practiced with meat.

"Dairying Remote from Markets," was treated by G. H. Merwin. He indicated that such localities were admirably adapted for raising well bred cows to supply the herds of dairymen more fortunately situated nearer the markets, who rarely raise the cows they use. The demand for such animals greatly exceeds the supply. Such work would tend to reclaim our abandoned farms, and the idea presented by the speaker was received with enthusiasm.

James B. Paige, D. V. S., of Amherst Agricultural College, gave a stereopticon lecture on "Stable Ventilation." This was a very interesting discussion of a most important and almost universally neglected feature of dairying. All ventilation is embraced in two systems, viz., natural or artificial. The forces of the former are:

1. The difference in weight of bodies of air of unequal temperature.
2. The law of the diffusion of gases.
3. The wind.

These forces were described and their action illustrated on the screen. Modern stables are preferable because they make possible the control of ventilation. Stables should run north and south as this ensures a more uniform temperature. Two sets of openings are necessary; inlets and outlets. In artificial ventilation the inlets should be above and the outlets below, while where natural ventilation is used, the process should be reversed. Ventilation from the south side of buildings is more effective than on the north. In constructing air shafts or ducts, sharp turns and corners should be avoided, as each right angle reduces the velocity one-half. Ventilating systems should be carefully examined to see they are not obstructed.

"The Cheese Industry of Canada" was ably discussed by T. J. Dillon, St. John, N. B. The development and growth of this industry, from its birth in 1864 to the present time, was clearly set forth. In 1865 Canada imported 360,000 lbs. of cheese from the United States, and in 1899 Canada exported over 17,000,000 lbs. Canadian cheese formerly sold for less than States cheese, but since the introduction of filled and skim cheese, the tables had been reversed. The educational benefits, derived from co-operative dairying, had proved to be of great value. Due to the efforts of government, the quality of cheese was uniform throughout the whole dominion of Canada; this added commercial value to the product. Mr. Dillon exhibited a lot of Canadian cheese, which was distributed to the audience. The verdict was unnanimous regarding the high excellence of the cheese. If all Canadian cheese is like this, and Mr. Dillon assured us that it was, it is not hard to realize the supremacy Canada holds. However, there is no reason why cheese equally as good or better, should or cannot be made in the United States.

Prof. J. L. Hills, director of Vermont Agricultural Experiment Station, spoke upon "Economical Dairy Feeding." The matter was presented and discussed in a masterful manner, being a brief, concise exposition of the foundation principles of feeding and thence on up to the direct economical phases of the problem. The main roughage for Vermont is early cut hay, silage from mature corn, oats and peas and clover. The best concentrates to use with these are cotton and linseed meals, gluten meal and feeds, brewers grains and bran. Silage should be made from mature corn as that made from inmature corn is but an expensive way of watering cows. The fallacy of purchasing corn was clearly demonstrated. Corn should be grown extensively, and only some of the concentrates mentioned should be purchased in order to balance the ration. Corn should be siloed for dairy feeding. Siloing corn was the most economical method of handling the corn crop as was demonstrated by experiments made at the Vermont Station. In these experiments extending over three years the corn crop was handled in four different ways, and the best results had always been obtained from the ensilaged lot. Corn silage had also proved to be of great value to sustain the milk flow in periods of drought. Referring to condimental foods, the speaker's views were well illustrated by stating that a brand advertised in Vermont as a "famous food" should have the prefix "in" attached to famous. Not so much that condimental foods are devoid of value, but because the prices charged are outrageously exorbitant.

During the session suitable resolutions were passed, endorsing the "Grout Bill." The scoring of the butter exhibited was high. It was reported that the average score was higher than that made this season at any other exhibition in New England; however, this requires confirmation. In the creamery class, Granby creamery stood highest with a score of 98. In the private dairy class 97 was the highest; this was placed upon butter made by C. B. Pomeroy, Jr.

The meeting was one of the most sucessful

DISBROW

Some say it does all we claim.
Others say we don't claim enough.

Two Questions.

Since we first placed the Disbrow Combined Churn and Worker on the market we have been obliged to spend thousands of dollars to defend our patents against unscrupulous competitors. **WHY ?**

Every salesman who tries to sell any other make of combined churn and worker always compares his machine with the Disbrow. **WHY ?**

Because the Disbrow, the pioneer machine, is recognized to-day as the standard combined churn and worker—the only machine of its kind which has **proved** itself to be a success. What others cannot steal, they try to imitate. Drop us a postal card.

Mr. VALANCEY E. FULLER, in his pamphlet on the ST. LAMBERT family of Jerseys, **places KING OF ST. LAMBERT'S KING 30752 in front of all other Jersey sires,** when he says:

"Mr. Hart has now in his herd all the registered daughters of King of St. Lambert's King, 16 in number. *I am frank to admit that I never saw so many matured daughters sired by one bull* (save Stoke Pogis 3d) *who are their equals in individuality, in good dairy form, in large, well rounded fore-udders, in large, tortuous and elastic milk veins, in uniformly large and well placed teats, in depth and length of barrel, in straightness of back, and all that goes to make a most desirable individuality.* They are not in the least degree coarse."

King of St. Lambert's King 30752

is at the head of my herd. I have for sale a few young bulls rich in his blood.

FRANK W. HART,
Cleveland, Ohio.

☞I have a few extra copies of Mr. Fuller's pamphlet, which I will mail free to applicants as long as they last.

THE BOER WAR

is exciting acute interest in all parts of the world, but the subject of vital interest to agriculturists in all parts of the United States is

How to Make More Money on the Farm.

The surest way to do it is by following in the footsteps of those who are the most successful, and a path is blazed straight and clear through the colomns of

THE PRACTICAL FARMER, of Philadelphia.
America's Leading Agricultural Weekly. $1.00 PER YEAR.

It is the only purely agricultural weekly published whose contents are directly applicable in an intensly practical manner to the every day work on the farm. Its editors comprise the leading agricultural writers of the country, and its **Unique Special Departments**—Experience Pool, Short Cuts, Mistakes, Failures and Successes, Farm Implement Annex and Postal Card Correspondence (all of which are supported by contributions from its readers, and for which contributions CASH PRIZES are paid every week), keep it in close personal touch with subscribers every week in the year.

The Practical Farmer's Library, issued quarterly, is one of the most valuable additions to agricultural literature ever published. You can learn full particulars of it in the columns of The Practical Farmer. **The Supply Department** of the Farmer Co., is prepared to quote you an inside price on anything you wish to buy, from a needle to an anchor.

No. 12 Farmers' Supply Catalogue contains 208 pages, illustrated and quoting wholesale prices on hundreds of articles of every day want. It also contains **a complete Calendar for 1900.** Send a postal card to The Farmer Co., 18th & Market Sts., Philadelphia, mentioning HOARD'S DAIRYMAN, and they will send you sample copies of The Practical Farmer, also a copy of No. 12 Supply Catalogue. **WRITE TO-DAY.**

SPECIAL OFFER.—By special arrangement with The Farmer Co., we are enabled to offer The Practical Farmer and HOARD'S DAIRYMAN both one year for **only $1.50.** Address all orders to
HOARD'S DAIRYMAN, Fort Atkinson, Wis.

ever held by the Association. Much good must follow from the zeal it has inspired.

F. H. STADTMULLER.

The Churn Overrun.

ED. HOARD'S DAIRYMAN:—There is no publication I read with more pleasure and profit than HOARD'S DAIRYMAN. It is alive and abreast of the advancing times in which we live to-day. But I feel you are doing an injustice unconsciously, by asserting the butter increase over fats to be 16 per cent in all cases. New England creameries are largely sending out their entire make in the form of print butter. Unlike the Western creameries we do not tub any of our product. To secure the top price, our prints have to be faultless in weight, as well as in quality, and this weight must be full, even after the prints have dried 4 to 10 days. Hence each print must be a "heavy 16 ounces" when made. We are never able to weigh out 60 lbs. and make 60 1-lb prints from it. On the contrary we average but 56½, after repeated trials. If all our butter were packed in 60-pound tubs, we should have a greater butter increase. As it is, under our system, pursued to gain the highest approval of consumers, we make a gain of 8 to 12 per cent, averaging about 10 and have sometimes run under 8, after careful accounting. Our churning is excellent, losing less than .2 per cent. Just how other print making creameries do I am not aware, but we, long ago, went back to the old method of dry working, that is, working and salting on taking it from the churn, setting it in the cooler until next day, and then working thoroughly before printing.

The butter is thus more solid, and more satisfactory to customers, and it is one of the things that has brought us our reputation and our sale on the market easily and regularly at a price much above the choicest Elgins. During the past five months our patrons have received 25 cents for fats twice and 27 cents three times, and we are not co-operative. We are aware that a heavier churn gain can be made, but it is not a profitable policy for our specific trade, which is somewhat out of the beaten path. We are trying to get on to the top shelf of public estimate, and to stay there.

It is gratifying to see your efforts along the line of teaching us how to balance our cows rations profitably. So many of us are feeding away our profits, and do not know it. Please tell us again and again, in plain terms, just how to select and balance them ourselves. Oh, if our dairymen would only study this thing closely, for their own profit in dollars.

South Britian, Conn. HOLLISTER SAGE.

The DAIRYMAN does not claim that the overrun is 16% in all cases, but that such a gain is quite possible, and still have a standard commercial product. Under the conditions which our correspondent is working, cooling the butter and working twice, we should not expect an overrun any larger than he gives, but that is an exceptional case, and his butter is made to cater to a certain trade that calls for a very dry butter. Moreover, the way in which the butter is packed, heavy weighted prints in this case, can hardly be said to be a fair comparison with the usual method of packing, in tubs directly from the worker. We do not doubt, that with special care, butter could be obtained with half the amount of water that is usually present, but that would not be a fair example of the *average* overrun.

Station Work in Testing Cows.

ED. HOARD'S DAIRYMAN:—As you are doubtless aware, our Experiment Station has for a number of years past been conducting milking trials of pure-bred cows owned by Wisconsin breeders and farmers, the production of milk and butter fat being determined in all cases. The results of the tests have been published from year to year in the reports of the station. In the 16th Annual Report, just received from the printer, will thus be found official tests of 73 cows of the Holstein-Friesian breed, 7 Brown-Swiss cows, and a semi-official test of the two Guernsey cows, Lily Ella and Lilyeta that within the past few days have brought such credit to their owner and to the state, through their wonderful year's performance. The initiative to the official tests as now conducted was taken by the Holstein-Friesian Association, and by far the greater number of cows tested up to the present time belong to this breed, but the facilities thus extended to Holstein-Friesian breeders are open to all farmers and breeders in the state, without regard to breed.

The testing is done by graduates of our Agricultural College, who have proved themselves able and fitted for this work, and is done under the supervision of an officer of the Experiment Station. Prof. John Decker had charge of this work while connected with our Station; since his appointment to the position of Professor of Dairy Husbandry in the Ohio State University, the supervision of the tests has been placed in the hands of the undersigned. The work has now been systematized and rules for breeders wishing to have cows tested have been formulated, as well as directions for our Station representatives conducting the tests. These rules and directions have been decided upon in conferences by Dean Henry, Dr. Babcock, Prof. Carlyle and the writer, and are in force from the beginning of the present year. We wish to have it known that our Station stands ready to assist Wisconsin farmers in conducting official tests under these rules, and also desire to have our farmers feel that the work is done in such a manner as to exclude any doubt concerning the accuracy of the results obtained.

I am personally greatly impressed with the far-sightedness of the Holstein-Friesian Association in being prime movers in tests of this kind, in which the award of prizes is based on the production of butter fat, by cows under home conditions. Great credit, not only from Holstein-Friesian breeders, but from breeders of dairy stock everywhere, is due to the efficient Superintendent of the Advanced Registry, Mr. S. Hoxie, for his services in arranging and directing these official tests. I hope to see other dairy breeds follow the example thus set, to a larger extent than heretofore, and make provision for tests conducted by disinterested parties whose work is closely supervised and checked up by our State Experiment Stations or similar institutions. F. W. WOLL.

Wisconsin Experiment Station.

The rules above referred to were published on page 962 ante.

"Housework is hard work without Gold Dust"

Cleaning Silver

Instead of scouring and rubbing each piece of silver separately, the whole service can be as effectively cleaned in a few minutes. After each meal the silver should be put into a pan (kept especially for the purpose) and cover with lukewarm water, to which a teaspoonfull of

Gold Dust Washing Powder

is added; set the pan on the range until the water gets to boiling point, then lift out each piece with a wire spoon and lay on a soft linen cloth, wiping quickly with chamois skin. The pieces so cleaned will be highly polished and look like new.

Hot Water at the Barn.

Paper No. II.

ED. HOARD'S DAIRYMAN: — Several articles may be required to answer letters received. This seems to be a new idea, and many are waiting for more information. The system of pipes used in houses for carrying hot water, could not be used at the barn on account of freezing in severe weather.

I have another way of heating water at the barn, far better and cheaper for those who have a tank heater of any kind. Farmers have been in the habit of warming milk and other feed for calves and hogs over the kitchen stove, much to the annoyance of the good housekeeper.

As I had a new tank when I began to heat water to a high temperature, I could have it made in any way that seemed best to me. It is made of 2×6 pine 18 feet long. The ends are made of matched plank cut in the form of a half circle with six inches added, to give more depth for a heater. The ends are fitted the same as the heads in a barrel, only I have four heads instead of two, dividing the tank into three parts. The heater is placed in the central part and the warm water can pass to the end division by means of large holes bored in the head. These can be closed and I can heat the water in the center to 120°, while the drinking water at the end is only 60°. The water at the opposite end is only a reserve, to be used when the wind fails. There is a pipe extending to the stable and I can pump from either part.

Now, most of my readers have a tank of some kind and do not want to throw it away. If the tank is flat on the bottom and you use a cylindrical sheet iron heater, buy a dry goods box made of matched lumber and put your heater into this. Bore holes three inches in diameter, one above the other, and as many as you please. Should the box be too high, saw it open, so it will not be quite as high as the top of the heater.

Place a piece of board 3½ inches wide perpendicularly on the outside of the box so that it shall cover two holes and reach three inches above the box. Midway between the holes, bolt this piece of board to the box and by using the upper part for a handle these holes can be opened or closed at any time you wish and you can heat the water inside the box to about 120°, and set in 8-inch creamery cans of milk or any feed you wish to heat. This will be likely to reduce the temperature to 100°, which is the proper temperature for feeding cows, calves, hogs and hens.

I have never seen nor read of anything of this kind, but anything not patented is free for everybody to use. While it may not be the greatest invention of the age, it shows you how by investing a single dollar, the advantage to you will be at least $5 every winter.

If any one has another kind of a heater, let him describe it, and another plan will be submitted for his consideration.

A few new tank heaters are put in every year, but now not more than one-third of the farmers in this vicinity have them, and we may infer the other two-thirds have never yet been able to see the necessity of warming water for stock.

To study the matter on its merits, we may test the effects of ice water by drinking it ourselves, only we must notice one great difference: Man has a stomach rather small in size, as he eats concentrated food, but cattle live upon grass, hay and other kinds of bulky feed, and have a stomach much larger than man in proportion to their weight. A healthy man weighing 150 pounds, may drink a single glass of ice water, summer or winter, without injury, provided he is not over-heated with work. A cow weighing 1200 pounds will drink more than eighty glasses of ice water at one time, when watered once a day. If it happens to be very rough and stormy, she will often return to the stable without drinking. The following day she will take a double allowance, or 160 glasses of ice water, which would be equal, in cooling power, to twenty glasses for a man, if he had a place to put it. The whole expense of warming water is less than a half a pound of butter a day for those that keep twenty cows, and the majority of farmers are asking, "Will it pay?"

The different kinds of tank heaters, and the different methods of cleaning, will be discussed at some future time.

Oconomowoc, Wis. N. B. WHITE.

Call for a Meeting of Guernsey Breeders.

ED. HOARD'S DAIRYMAN:—Some years ago an attempt was made to organize, here in the west, a Guernsey Breeder's Association like the one in existence in Pennsylvania and adjoining states, and with which the DAIRYMAN readers are familiar through the regular reports of their proceedings published by you.

Our failure here was for lack of numbers, but as there are now in Wisconsin and nearby states nearly one hundred persons breeding pure bred Guernseys, we feel sure such an association could be maintained with pleasure and profit to its members.

Our object is to be mutual acquaintance and helpfulness and to bring more fully before the public the now well known yellow skinned Guernsey.

After consultation, the undersigned Wisconsin breeders ask all interested in breeding Guernseys here in the central west to meet at Watertown during the Dairymen's Association Meeting February 14th, 1900, and help organize such association. Place of meeting will be announced at opening sessions of the Dairymen's Association.

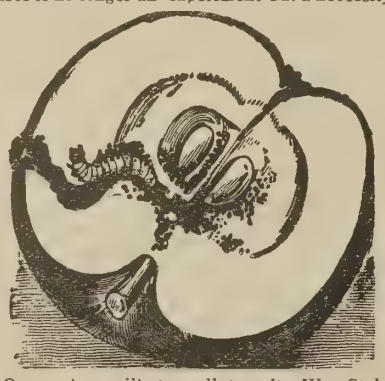
CHAS. L. HILL.



A Hard Nut to Crack.

ED. HOARD'S DAIRYMAN:—I want to give you a nut to crack in the Inquiry Department of HOARD'S DAIRYMAN.

I have no rough food for my cows, owing to extreme drouth, other than cotton seed hulls, and want as near a balanced ration as possible with cotton seed meal at $22.00 per ton; bran, $20.00; corn meal, $20.00; rice bran from small country mill, that mixes chaff and a great deal of cracked rice, at $10.00 per ton. I have on hand two (2) tons ground Spanish peanuts and hulls. I have been feeding some of the peanuts but

SPRAYING FRUIT TREES.

The question of spraying fruit trees to prevent the depredations of insect pests and fungus diseases is no longer an experiment but a necessity.

Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalogue describing twenty-one styles of Spraying Outfits and full treatise on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking.

A Top Pedigreed **POLAND CHINA SOW**, bred, $18.75; July pigs $7 to $10, none better. 12 years experience. S. HAWK, Mechanicsburg Ohio.

A New Book for Stockmen—Proceedings of Guernsey Breeders Ass'n.—1884–'99. It is of value to all breeders of dairy cattle gives practical experience of many prominent men on breeding and feeding problems, treatment of diseases, etc.; numerous valuable essays on special topics. $1 post paid. W. B. HARVEY, Sec'y, West Grove, Pa.

ALBION JERSEY HERD is headed by
Pedro's Prince Phillis 42298,
An Ideal Dairy Sire, carrying 75% of the blood of PEDRO 3187.
R. C. GREEN, Albion, Wis.

JOS. T. HOOPES, Bynum, Md.

Black Earth Jersey Herd
Offers for the next 60 days a few choice Young Bulls from 3 to 6 months old, at reduced prices. Address, FRED STUBLEY, Black Earth, Wis.

Best Fodder Plant for West and Northwest.

Sand or Hairy Vetch makes best fodder plant that can be obtained for West and Northwest. Eaten with relish by hogs, cattle and sheep; it stands severest drought, heat or cold. Sown as soon as the frost is out of the ground in the spring, it makes heavy pasture in fifty days, or can be allowed to mature for hay crop. Sown in fall makes excellent pasture, which, after eaten close, will appear as heavy pasture the following May. Superior to clover as fertilizer and soil renovator.

Enough for an acre sowing for $1.00. For prices on larger quantities see

Catalogue sent FREE on request.
CURRIE BROS., Seedsmen, Milwaukee, Wis.

Write for what you want. Visitors always welcome. **JOHN E. ROBBINS, Greensburg, Ind.**

gave too much at first and the cows did not like them after awhile, owing to too much oil, I guess.

Will it pay to plant kafir corn and millo maize for cows, and grind seed and shred stover?

I can buy mixed Bermuda and Johnson grass hay for $15.00 per ton. Will it pay to use at that price? If so, will it pay to cut when I have power cutter, or feed long? I will soon have rye pasture for cows.

Cotton seed hulls are $3.50 per ton.

Columbia, S. C. W D.

W. D. has indeed given us a hard nut to crack; so hard that after several attempts which have proven futile, we give it up. Where one has feeds, like the rice bran referred to, which are so entirely out of the ordinary, no man can estimate their feeding value. The same is true of ground peanuts and hulls. In none of the books to which we have access is there any record which shows either their analysis or their feeding value. All that can be done in a case like this is to pioneer a way for oneself, going forward carefully so as not to repeat the mistake that was made with the ground peanuts and hulls. We think if one would commence with, say, 2 lbs. of cotton seed meal, 2 lbs. of corn meal, 2 lbs. of bran for the grain part of the ration, and then all the cows could eat of the so-called rice chaff mixture and cotton seed hulls, the results will tell him in what direction to increase and in what to decrease.

We incline to the opinion that it might pay very well to plant kafir corn and millo maize for cows, but instead of allowing this to ripen seed, we think it preferable to cut and cure them for hay. In the south one could grow peavine hay in sufficient quantities to furnish all or nearly all the roughage required. He might then plant kafir corn and allow it to ripen seed and use the seed to complement the peavine hay as they do in Kansas and Nebraska, to furnish a complement for alfalfa hay.

Comparative Value of Bean Pods.

ED. HOARD'S DAIRYMAN:—At present am milking six cows, grade Jerseys, weight from 700 to 900 lbs., three heifers with first calf, one fresh last July, and the balance in November and December. In the morning they get a feed of corn fodder about ⅓ eared, oat and pea or wheat straw at noon, and bean pods at night. For grain, I mix 200 lbs. bran with 75 lbs. ground oats and peas, feed all they will eat up clean, which is about 4 lbs. night and morning, before they have their coarse fodder. Have no way of cutting the corn fodder. Expect to have a silo next season. I have a little hay, clover and timothy mixed, which I feed once or twice a week in place of corn fodder. Here in western New York we consider bean pods for one feed a day nearly if not quite as good as clover hay. Would a little gluten feed help the ration? Milk goes to the creamery every other day. My last test was 4.6, has been as high as 5.2. At present the six cows are giving about 135 lbs. of milk a day. Bran, $17 to $19 per ton; hay, $12; clear oats about 35c per bushel. Do not know the price of gluten feed?

Perry, N. Y. P. G. N.

We are personally so well pleased with gluten feed, that we should not hesitate to use it with almost any combination, but the plan for our friend to pursue is try it in a small way at first and let the results guide him.

An Iowa Combined Barn and Silo.

ED. HOARDS' DAIRYMAN:—Enclosed please find $1.00 for renewal of subscription to your paper. A good paper, like a good cow, is worth more than it costs, while a poor one, like a poor cow, is dear at any price.

Silos must be very good things, however built, for each one seems to think his the best. We built a large, round barn last summer, 40 feet in diameter, with 16 feet silo in the middle, leaving 12 feet ring of hay around silo. The track over this ring, drops the hay in place with little or no mowing away. The hay keeps the silo warm, the silo supports the hay barn roof. The shute connecting hay barn and cow barn, forms a ventilating chimney, and the door between cow barn and shute is hung on weights so that it may be raised or lowered as more or less ventilation is desired, and is open at bottom if anywhere. We consider it a handy and economical arrangement.

We pump water with an ejector or jet pump. The steam goes right into the water, and warms it, at the same time it pumps it. A feed cooker boiler furnishes the steam. The cows say "thank you" for the warm water quite effectually.

At present prices for butter it is easy to make money feeding $9.00 bran; if we can't buying bran at $9.00 per ton, how can others at $14 or $16, as I see some say they have to pay? Two dollars per ton in the stack for good hay was the price last year and year before, and the price in the stack is what it is worth to the farmer. SCOTT H. LILLY.

Worth Co., Iowa.

CONCERNING OUR ADVERTISERS.

Northrup, King & Co., the Minneapolis Seedsmen, announce that the Great Northern, Pacific and Soo Railroads, will on February 1st, put in effect half tariff rates on grass seed, clover seed and Dwarf Essex rape seed, to points on their lines in Minnesota, North Dakota and Montana. This applies to both car and less car shipments.

The railroads appreciate the importance of renewing with tame grasses, the natural grasses which are disappearing so rapidly, and are to be credited with taking a view of the matter which is both broad and helpful to all concerned.

Credit is also due Northrup, King & Co., for taking up this question with the railroads, and bringing it to a successful conclusion.

WHAT IS BROMUS INERMIS?

Our attention has been directed to this wonderful new grass by L. L. May & Co., St. Paul, Minn., whose advertisement appears elsewhere in this issue.

Bromus Inermis or Brome grass, while referred to above as being new, is not entirely unknown in this country, but it is in its native country of Russia that it is most highly appreciated. Its prime characteristics are its wonderful productiveness and ability to grow, thrive and produce abundant crops of pasturage and hay in dry, semi-arid sections and localities, where other grasses fail signally. It is hardy, almost beyond comparison and is not affected by drought, will not winter kill and cannot be flooded out. It grows as well in low swampy places as in the lighter, dry upland where other grasses fail. This enables every farmer to make productive, portions of the farm that would otherwise be waste land. It has been found that the yield is greater than alfalfa; that it will produce heavy crops on the lightest of soils; that one seeding will last under ordinary conditions for twelve years; that it grows best when seeded alone, and not in combination with other grains, and that the food value when converted into hay is superior to timothy of the same quality.

There are many sections of the country where Brome grass will prove of large value because of the excellent qualities enumerated above. In localities where there is only slight rainfall or where there is only a limited amount of water for irrigation purposes it would seem especially wise to experiment with this grass. Write May & Co. for any special matter they may have on the subject. We feel personally that a new forage crop that offers such promise deserves the most careful consideration and investigation.

KENDALL'S SPAVIN CURE.

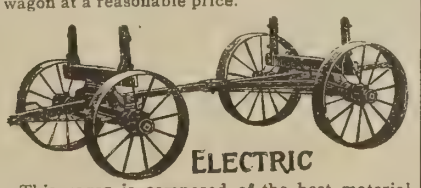
HILLSVIEW, Pa., Nov. 7, 1898.

DR B. J. KENDALL CO.

GENTLEMEN:—I am a user of your Spavin Cure and can recommend it as the best horse medicine I have ever had in my stable. I used it on a valuable young mare that had the bone on her hind leg injured by a kick; she was lame for four months, but one bottle of your medicine cured her as sound as a dollar. The beauty of the thing is that it does its work and does not remove the hair; it takes an expert to discover that you are using medicine at all.

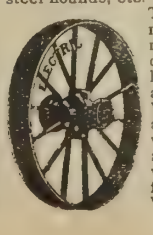
You will find enclosed a two cent stamp for which you will please send me one of your "Treaties on the Horse and his Diseases." Yours,

H. C. ARBAUCH.



There is probably no better farm fence made to-day than the "Advance," which is now so well and favorably known to the farmers. It is a completely interwoven wire fence, without any loose ends to unravel or injure stock. It is so designed that it takes up all expansion and contraction and remains tight always. Then too, the method of selling is specially desirable, as it is sold direct to the farmer at factory price. Nobody can buy it any cheaper than the man who uses it. Write the manufacturers for prices, etc. Advance Fence Co., 126 Old Street, Peoria, Ill.

BUYING A CARRIAGE.



Modern merchandising has become so simplified that those living in the remotest corners of the country are brought into close touch with the great manufacturing centers, and almost anything from a toy to a steam engine may now be bought from the makers, saving the buyer from two to four profits. A most successful application of the method of selling direct from the factory, without the intervention of middlemen, has been made by the Columbus Carriage and Harness Company of Columbus, Ohio. This company manufacture a splendid line of carriages and other vehicles and harness, besides dealing largely in robes, blankets and horse equipments. These they sell direct to those who use them, with the distinct understanding that any article which may not fully satisfy the purchaser, may be returned and the price of it will be refunded. By addressing the Columbus Carriage and Harness Company, Columbus, Ohio, any intending purchaser may obtain a copy of the catalogue, which contains illustrations and complete descriptions of all their goods, and fully explains their progressive plan of selling direct

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy, Ill.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

Guernsey Cattle.—The Old Homestead Herd has repeated in '99 its triumphs of '98. Winning nearly ¾ of all the prize money it contested for at the O., Ind., Ill., Wis., State Fairs. Also winning a signal victory for the breed at Ohio, being awarded the Grand Sweepstakes Herd Prize for best dairy herd any breed, against fifteen competitors for the cup. Address inquiries to L. V. AXTELL, Perry, Ohio.

Riverside Guernseys, CHAMPION Herd AT NEW YORK STATE FAIR, 1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Comments and Queries from Robinswood Farm.

Development of the Cow's Vegetative Organs Primarily Important—Are Great Expectations of Breeders' Duties Reasonable?—Influences Creating Dairy Prepotency—Hereditary Transmission, "Nicks" and Selection—Family Prepotency More Important Than Great Individuality In Parentage—The Questions of Size and Hardiness in Cows.

ED. HOARD'S DAIRYMAN:—The external form of a cow affords to a certain extent an indication of her dairy producing qualities, but not entirely. Of course an accurate observer, one trained in the matter, can pretty accurately judge as to the development of the cows' internal organs and their functions by various outward signs that are difficult to describe in words, just as a competent medical man can walk along the street and size up his fellow mortals' internal works and ways, to a certain degree, by a mere look in the face. But actual performance can only surely determine the development and functions of the important internal organs such as the true stomach, pancreas, intestines, liver, etc.

Nevertheless the profitableness of the dairy cow is based on, and starts from, a prominent development of these organs and of their functions. She must not only have an outwardly observable dairy form; she must have good teeth in her strong jaws, and a good flow of saliva, whose function is not only to moisten and lubricate food, but also, along with the secretions of the pancreas (sweet bread), liver, stomach and intestines, to turn starch into sugar. This cow must have a large paunch in which large amounts of crude food can be macerated and softened by moisture, heat and benign fermentation. Her fourth stomach must be sufficiently strong and active to create acid gastric secretion in sufficient quantities to turn all of the protein of the food into the liquid peptones, which, with the liquid sugar and such emulsified fats as may have been so formed from the fat in the food, are absorbed into the general system of blood vessels. Furthermore, she must have a strong heart for the effective and quick pumping of this liquid nourishment to all parts of her body.

I believe that one reason why there is so much poor dairy stock in existence is that breeders do not appreciate the primary importance of breeding for such unseen developments. If they do appreciate it, many of them certainly do not take the necessary steps to secure such developments. So-called constitution is largely a matter of a strong heart action and a perfect circulation of the blood. There can be no very profitable dairying with cows that do not have strong constitutions and great digestive and assimilative capacities, as well as large mammary development. A large product can be secured from a delicate cow, but hardly an economical product.

A possession of all the necessary parts making up the good dairy cow is not confined to any one breed. Still there is no question in my mind but that there is a recognizable choice for each dairyman's requirements. I have made up my mind by this time as to the breed we Gilmanton butter farmers ought to use for our particular profit, but decline at this time to name my choice for fear that every reader who favors any other breed, would be likely to consider my powers of perception and judgment of little value, and although I am old enough to appreciate how little of the sum total of knowledge I have been able to absorb during my life so far, still a body likes to have full credit for what he does know.

A direct purpose of these "Comments and Queries" is that any views I may have held, or may acquire, in regard to cows or dairying, may be subject to criticism and correction if erroneous. It is a very narrow, small man who is not willing to acknowledge himself in the wrong if he becomes convinced of error. One should never be ashamed to acknowledge a change of view if it is the result of honest conviction; but on the other hand, one must stand up for one's views if one believes them sound.

Unjust criticism may be the result of careless reading. This seems to have been the case in the criticism of Mr. W. S. Seeyle in the issue of Nov. 17th last. I certainly do not believe, as Mr. Seeyle seems to think I do, that a poor extended pasture will tend to produce a large sized cow. The contrary is my belief; and it is because so many American dairy farms have just such poor, though large, pastures that a small or medium sized cow is the most profitable for them. Hence we have no use for Holsteins on our Gilmanton hills, though under certain conditions of environment, I consider her the ideal cow. But if the pasture is rich and feed abundant, a considerable amount of exercise does tend, among other influences, to produce a large cow, more blood being directed to the general frame as a result of the use of the muscular system, the largest in the body.

I do not believe that breeders should particularly strive for large size in their dairy stock intended for use on the average American dairy farm, though I believe that other things being equal, the larger the cow the less will be her cost of support in proportion to the costs of production. She will also be more economical in the use of stable room, milking and general care. Perhaps also more profitable in the side matters of beef and veal. Still as long as extended pastures are to be utilized, an animal is to be desired that will not use up too much vitality in moving herself over extended poor feeding grounds. Futhermore, as early and frequent maternity is one of the influences productive of great milking powers, if such development is attained, a relatively small development of the whole body would be expected, as a rule. The exception would be under conditions where a very great supply of easily digested food was supplied, and in particular, of foods largely protein in composition.

Just at present my mind is on the "bear" side of the bull question, and I find myself mentally laying down the law quite extensively as to what kind of prepotency the breeders ought to be able and willing to furnish (for a consideration) to those of us who want to develop a profitable dairy herd. Perhaps if I had better stock to sell, I might look at the matter from another point of view. I might think I had a perfect right to put my best foot forward, or in other words, bank on "weekly tests;" and decline to publish my average yearly products for a fear of a lessened patronage, especially as a year's forcing for a yearly test would be likely to do great damage to my stock, and that farmers ought to be satisfied if I could show a large weekly test.

Well, perhaps that is all true. A cow that can produce fourteen pounds and over of butter in one week, certainly has some good qualities, and if a lot of her ancestors on both sides could do as well, she ought to have some desirable prepotency, and even, if the farmer should have to depend on his natives to furnish his herd constitution and digestive power, it would be well worth paying for a bull that could furnish the other requirements of a special-purpose cow.

I suppose it is rather too much to ask of the breeders that they shall furnish a large and perfect mammary development, harmoniously proportional to the general frame, great digestive power, constitutional vigor, placid temperament, etc.; and also prepotency to perpetuate such abundant excellencies. Such combinations make up the perfect cow, and such cows are few and far between. Nevertheless, when the farmer is going to buy thoroughbred stock to improve his herd, let him strive for the most perfect of individuals, as well as select that breed best adapted to his particular requirements. I think also he would be unwise if he does not try to find out how much his chosen blood is capable of doing in the way of

yearly yield, and how economical it may be in producing dairy products.

Very few thoroughbreds are perfect in all things, but let the dairyman be sure of certain absolutely necessary requirements in the stock, and to this he can add lacking points himself. There are certain desirable dairy qualities which the farmer can create and maintain with more ease than can the breeder. This brings us to a consideration of the influences which are potent in producing dairy qualities in cows.

It seems to me that they are for the most part, hereditary tendency, fortunate "nicks" in breeding, selection, suitable feeding, favoring climatic conditions, shelter, maternity and mammary stimulation, and appropriate exercise and other hygienic conditions. It is perhaps not possible to state which of these influences is the most important. It seems to me that breeders are inclined to ascribe too much weight to mere hereditary influence as a source of improvement.

Hereditary transmission of qualities may be either good or bad, and it is only when selection is brought into play, that improvements varying from the general type, the result from fortunate "nicks," or of other causes, can be perpetuated. Nevertheless by pairing individuals, who carry within themselves the prepotency of many desirable ancestors, and by persistently culling out and rejecting for breeding purposes, individuals which are not up to the mark, we can expect to maintain, and even accentuate dairy qualities.

But careful breeding is not the only and fundamental causation of dairy function. Breeding transmits, and to a considerable extent accentuates and strengthens desired form and function; but one must look further and deeper for the fundamental causes of such developments. As a rule, phenomenal cows, it is well known, do not reproduce themselves. They reproduce the sum total of themselves and their ancestors, modified by all the influences of the sire and his ancestors. Hence is seen the importance of selecting a bull and also cows having a desirable list of ancestors, in preference to selecting merely because they may be progeny of a phenomenal cow, that may be phenomenal merely as the result of an unusually fortunate "nick," a conjunction of exceptionally favorable influences.

Of course, if one can start with the blood of a great and harmoniously developed cow, and one having great ancestors, so much the better. But as a matter of fact, the possession of phenomenal powers of milk production is rather against the giving of progeny the best prenatal nourishment, unless the cow is perfectly developed in all points—the digestive faculty being harmoniously powerful to sustain both great milk production and the nourishing of progeny. Of course, this does not apply in the case of the bull. I am inclined to think I would rather rely on the moderately excellent progeny of a good ancestry to perpetuate desirable characteristics, than the abnormal phenomenal and occasional product of such ancestry.

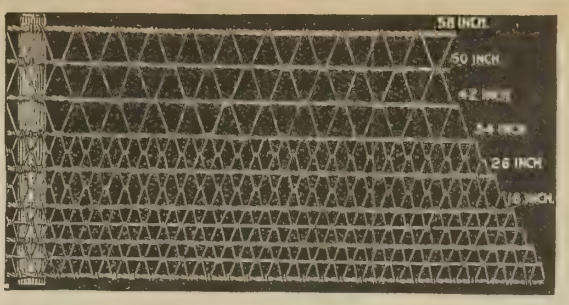
The one thing that is absolutely essential in dairy stock blood is a prepotent power to create in progeny a mammary capacity that shall be great in proportion to the other anatomical and physiological developements of the animal. If the farmer is going to feed a broad ration to his cows, a considerably greater development of frame and muscle may be allowable in his breeding stock than if a narrow, well balanced ration is to be fed; but even if the farmer is not going to feed a ration that will entirely utilize the powers of such mammary development, and also the demands of the general system; still if the large mammary developement is present, that mass of tissues will attract to itself, and turn to account its due proportion of all of the blood manufactured by the cow.

It follows then that the production of such prepotency is the first duty of the breeder. The dairy farmer then takes that prepotency and uses it according to his particular needs, even to diluting it. Inasmuch as it costs money and effort to create powerful milking qualities in a cow, it does not seem as if it would pay for the dairy farmer to breed up a herd with a mammary development very much greater than will suffice to thoroughly utilize the cow feeds he may be able to grow to advantage. This is one reason why I think dairy farmers should use grades. His cows can be developed in mammary qualities to the requisite extent by grading, and then stop before the strong constitution, etc., usually found in so-called native stock, should be too much weakened by the special aim in breeding.

Unless I am greatly mistaken, the average farmer would be much more sure of securing a herd of great performing cows in grades, great in every quality, except for thoroughbred breeding, than if he made use of all thoroughbloods. Would not these grades be more hardy than the thoroughbreds? I think so. Not that I think a thoroughbred must be delicate. I have had pure Jerseys, which in our cold and windy climate were, after acclimating, apparently just as tough and hardy as any other cattle in the district. The great St. Lambert family was developed in the far north. Nevertheless, it is a fact, that when an excessively large proportion of the food assimilated goes into milk, the animal is just that much short of stored heating material with which to meet the severities of climate.

Lack of so called hardiness is a matter of individuality rather than of breed, and a fine milch cow is not a Rocky Mountain goat, anyway. I feel sure that it will never pay the average farmer to give his cows as much care in the way of shelter, feeding, etc., as the breeder must give his stock, in order to create and perpetuate strong dairy prepotency.

It will usually pay the farmer best to feed more moderately, and accept a lesser product, and if this is the fact, it will cost him less to handle grades, many individuals of which will produce more than some thoroughbreds. Of course, I believe that some thoroughbreds will produce more than most grades, but as a rule, I doubt if they can work up crude cow feeds into dairy products with such economy as grades. Here there is a smart chance for the entertaining of a difference of opinion.



It is astonishing to think how little the dairy farmers of our county appreciate the importance of hereditary influence in improving or depreciating the productive qualities of their herds. Whether they elect to use grade cows or thoroughbloods, they can never afford to neglect to use blood in the sire whose influence tends to dairy function.

I never knew a farmer who was not smart enough to want to raise the heifer calves from his best cows; but what proportion of them ever give the question of the influence of remote ancestors in the herds production, its due consideration. And yet so far as I know here is the starting point from which lead two paths. The one may lead to dairy success, the other will inevitably lead to failure.

However dairymen may differ as to breeds, or as to the general make-up of the individual dairy cow, he must not ignore the fact that he has got to have a machine capable of doing a certain amount of productive work if he is going to succeed. His practice may be right in everything else, but if he makes a mistake in this fundamental matter he will go all wrong. We Gilmanton farmers want special-purpose butter cows, and some day we will all have them.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

SCOURS.

We have lost, lately, four calves from two to three days old with scours and these calves were from cows which were dry for a longer time and from heifers which came in the first time. The calves were healthy when they were born and it seemed that the first milk gave them the scours. We gave milk from other cows with the bottle, but could not save the calves. They were getting so weak and would not drink any more.

Washington, D. C. A. C.

ANSWER.

Own mother's milk is always much the best. The first milk is expected to open the bowels, always, in all mammals. In all such cases stop the usual milk supply for a few weeks and give slippery elm tea, flax seed tea, Iceland moss tea, gum arabic mucilage and to each pint add half a pint of strong caraway seed tea, all sweetened well with honey Give, say, three meals, thus, then mix the milk gradually until you get back to regular feeding. Keep dry and plenty of fresh air and sunshine

Some of the calves, like a person, may be more susceptible to the effects of the mucilage, etc., than others and will need good sensible attention. This simple but effective adjunct to the administration of medicine is sadly neglected by stockmen and much depends upon it, always. Be sure to remove the passages as soon as possible. Don't leave it where it can be smelt by any of the calves.

EPILEPSY.

We had 12 head of hogs that had been in a pen and fed for market, but not seeming to do well were let out in a field and slept at a hay stack. We then moved them about one mile and put them in a pen again. Did not change their feed except gave them a small amount of buttermilk and middlings mixed. In 3 days after they moved, they took fits and 9 of them soon died. They would mostly sit up on their hind parts and jerk their heads and froth at the mouth. A. P.

Beaverdam, Ohio.

ANSWER.

Epilepsy killed your hogs. Causes are multifarious andvery dissimilar. Whatever the cause, it is an affection of the nervous system. It is said to be incurable. Causes are as above various, injuries of any kind, especially to the nerve centers, crowding too much together, lack of pure air, etc. Like many other diseases prophylatics are the sure and safe course to follow. These are chiefly in good management. Epilepsy in the porcine is quite easily diagnosed. But it is a queer, mystifying, perplexing malady to combat and is fatal to the subject.

TINCTURE OF MYRRH AND ALOES.

I have seen in your paper, veterinary department, about compound tincture of myrrh and ointment of aloes, but it does not say how to mix, use, etc., or if it is to be mixed together for dehorned cattle. J. F. J.

Warren, Pa.

ANSWER.

Compound tincture of myrrh and aloes? Buy it at the druggist's of course, already for use and apply as directed.

LICE ON CATTLE.

My cattle apparently have every indication of lice. They rub and scratch against the buildings and fences, and the hair is coming off the neck. I have used equal parts of lard and kerosene, moderately strong of carbolic acid, but apparently of no avail.

Grand Blanc, Mich. W. F. G.

ANSWER.

Thoroughly wash all the denuded places with good tar soap and hottish water; rub quite dry, and then rub in well and liberally the following: Oil of tar, one ounce; pyroligneous acid, twelve ounces; sublimed sulphur, six ounces; fish oil, thirty ounces, to be used once a day until not needed; keep out of the wet; must be violently shaken before using, always.

INVERSION OF THE UTERUS.

I am having trouble with one of my cows. The channel leading to the womb comes out at times. Before she was fresh, it came out at times; I put it back; in a few days it would come out again. She calved all right, but the next day it came out again. I called in a veterinary; he put it back and sewed her up to prevent it from coming out again. In the course of time I cut the stitches; everything went fine for four and five weeks.

Mount Airy, Md. C. S. C.

ANSWER.

I know of nothing to do excepting to keep in the mass by any process you may please to adopt. Inversion of the uterus is always an annoying, troublesome thing, and hard to manage; seldom cured, usually, unless of a valuable type, making the calf extra valuable. The best thing to do is to fatten for market.

BAKING OF THE MANIFOLD.

A friend of mine has, in the last few years, lost four of his valuable cows with a stoppage of the bowels or stomach, as the stomach was packed with a dry substance, (food).

The first that we noticed was a loss of appetite and that no manure passed them of any amount. I gave them Glauber salts and linseed oil in reasonable doses. These cows were well cared for, with plenty of air, exercise, and what salt they wanted; was not feeding grain at that time, as they were all dry. F. A. F.

Cumberland Center, Me.

ANSWER.

Baking of the manifolds is quite prevalent in some places. You ask a puzzling

WOULD you rather buy lamp-chimneys, one a week the year round, or one that lasts till some accident breaks it?

Tough glass, Macbeth's "pearl top" or "pearl glass," almost never break from heat, not one in a hundred.

Where can you get it? and what does it cost?

Your dealer knows where and how much. It costs more than common glass; and may be, he thinks tough glass isn't good for his business.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

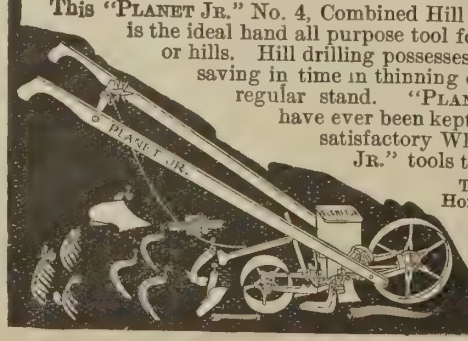
ILLUSTRATION.



THE INCUBATOR PROBLEM.

Among those machines which made a most enviable reputation at home in their own immediate territory before they sought a wider field, none stand out with more prominence than the Sure Hatch Incubators and Brooders, which are manufactured by the Sure Hatch Incubator Co., of Clay Center, Neb. The gratifying results have borne out the wisdom of the manufacturers in this plan of working. Another specially strong point of the Sure Hatch people seems to lie in the fact that they confine their efforts to but one kind of incubators and brooders, and devote all their time, energy and capital to attaining the highest degree of perfection along this single line. Perhaps the most prominent feature of these machines is the hot water tank, which is so constructed that no water rests over the center of the egg chamber. The tank is thickest and the volume of water greatest on the surrounding edges, just where the greatest amount of heat is required. This matter is fully explained and illustrated in the catalogue which every interested person should read before buying an incubator. The machines are automatic in every way and so constructed that by following simple instructions it is well nigh impossible to fail Write at once for catalogue, prices, etc., and kindly mention that you saw this little article in our paper.

IT DOES DOUBLE DUTY.

This "PLANET JR." No. 4, Combined Hill and Drill Seeder, and Wheel Hoe Cultivator, Rake and Plow is the ideal hand all purpose tool for the small or private gardener. It sows seed in either drills or hills. Hill drilling possesses many advantages, the greatest of which are saving in seed, saving in time in thinning out and greatly increased crops by making a perfect and regular stand. "PLANET JRS." were the first drills made to drop in hills and have ever been kept the best for the purpose. Can be instantly changed to a most satisfactory Wheel Hoe for cultivating all garden crops. Like all "PLANET JR." tools this one is guaranteed to be satisfactory in every particular.

The entire "PLANET JR." line of tools, embracing Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Harrows, Two-Horse Cultivators, Sugar Beet Seeders, Four Row Sugar Beet Cultivators, &c., is described in detail in our new 1900 catalogue. We have published 350,000 of these and think we have enough to "go round." To make sure that you get a copy, however, write today. Contains 16 page picture gallery. Free to all.

S. L. ALLEN & CO., Box 1107-D, Philadelphia, Pa.

question of me, when you ask your cause. Don't know. No oil; saline injection, and full doses of Epsom salts is the best treatment, after the drying up of the semi-digested food in the reticulum or second stomach, and then impacting the manyplies or third stomach. The proper way is to pay such attention to your animals that such impaction is nearly out of the question; attend to the food, and always see to the secretions.

ABORTION AND MANIFOLD.

I wrote you about two weeks ago about a heifer which I thought had a dead calf, and she has since died, and upon examination it was found that she had lost her calf prematurely, and her stomach was partly full of dry food; looked like it had been squeezed in the hand and dropped in lumps, but the small intestines were completely empty, save wind. Now what could have been done to save that cow? J. A. M.

Piatschie, Wash.

ANSWER.

You don't say which stomach. You have the same conditions as the above, with the addition of abortion. All the above remarks apply to your case. I never received any communication from you before.

LAME FOOT.

Last fall I bought a horse, put a rope on him and tied him in the meadow. He got tangled up in the rope, had it around his left hind fetlock, and ever since he has been lame. G. J.

West Denmark, Wis.

ANSWER.

There are two things to do, get a qualified professional man to fire the parts affected, or get a bottle of Gombault's Caustic Balsam, cut off all the hair close, get out all the dirt, then rub in hard for five minutes as much as you can get to be absorbed. Then cover as thick as butter, usually, upon bread. Do this, applying daily, but no more rubbing. When you have a good scab, cover with hog's lard until the scabs are all off, then repeat the balsam, and do up to about coronet.

Don't work him too soon after treatment, 4 months at least.

SCOURS.

I am having what we call calf cholera among my calves and so far have found no cure. If you have any please let me know through the DAIRYMAN. G. H. F.

Iowa Falls, Iowa.

ANSWER.

Scours in calves is not calf cholera at all. Remedy: Slippery elm tea, flax seed tea, caraway seed tea, gum arabic mucilage. These will be best if alternated one with the other. All must be given with judgment and intelligence. About a pint of either will be a fair sample dose; to each pint add one scruple of nux vomica and two tablespoonsful of old whiskey. This is for a month old animal, more or less for older and younger calves.

POOR CONDITION.

What can I do to improve condition of a grade Jersey heifer, coming three years old? For some months past has been subject to continuous drooling or slabbering, much like our horses in summer on white clover pasture. Have been feeding bran, corn and cob meal, clover hay and corn fodder. Have thought it might be either from indigestion or sore teeth. D. S.

Osawkie, Kan.

ANSWER.

Have a competent person examine the teeth. Some dental defect is no doubt the cause. It may be a tumefaction of the gums. If so, the same examination will develop the cause. After the professional examination, act in accordance with the condition and requirements. This is all I can do.

BAD MILK FROM QUARTER.

I have a cow that was fresh about three weeks ago. Calf lived only two days, and now she gives bad milk out of left front quarter of udder and very little of it. Cow was not fed any grain for sometime before she was fresh, but do not think she was milked as near calving as she ought to have been. C. H. S.

Haynesboro, Pa.

ANSWER.

Above all and everything a full dose of physic immediately and repeat and rerepeat after 5 or six days' rest. Each morning give two teaspoonfuls of nitre and continue for 2 to 4 weeks if needed. Milk her clean but do it gently. To increase the milk, feed more nutritious food but increase gradually after the doctoring. Don't neglect the physicking. Nearly all depends upon it.

ABORTION.

My cow calved the 20th of July, on the 17th day of August came in heat, was served, though she was in calf (she always got with calf inside of a month after calving.) On the 28th of December noticed a slight discharge of blood from vagina, no change any other way. On the 8th of January she came in heat, had her served 3 times immediately; still she remained in heat the balance of the day. Could she have aborted, or is it possible she could come in heat and be 4½ months in calf? If so, will having her served injure her? SUBSCRIBER.

Lawrence Co., Ill.

ANSWER.

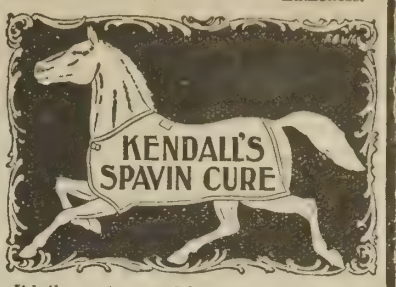
Yes, I doubt not the cow aborted, and you helped her to abort again by serving her as stated. Such is bad practice; always makes bad worse. Yes, a cow can and does come in heat when in calf. I have known of one cow which was owned here to take bull five days only before she calved, and never would stand without force, and if allowed to, would run to the bull.

ABORTION.

One of my cows aborted yesterday, fœtus about as large as a cat. This cow calved last February, calf was born dead, but was carried full time. She failed to clean, so I took afterbirth from her, following instructions I had read in DAIRYMAN. She was served frequently, but failed to get with calf till this fall. I was surprised to find her in heat to-day, but I didn't allow her to be served. Should she be served and would it be safe to allow my bull to serve her? I am about getting a young bull for these youngsters. I can get a well bred bull calf in this county, but the owner has had abortion in his whole herd; these are the first live calves he has had for several years. Would it be safe for me to buy this calf? D. H. G.

Emmitsburg, Md.

ANSWER.



No, she is not to be served at all until properly put in shape by judicious medication. Service adds fuel to the fire, always. Thoroughly clean all the surroundings of the aborting cow, and wash all her hinder parts with tar soap and hottish water. Use boiling water upon all the parts possible, of the stall and floor. You need a medicine to prevent abortion; the word cure is out of the question. No, don't buy a bull from an aborting herd. Read ads. of anti-abortion in DAIRYMAN.

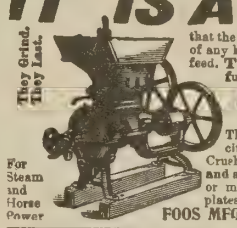
YOUR HORSE LAME?

That's bad. Lame horses are unprofitable either for use or sale. Don't have a lame horse. Cure him with

...KENDALL'S SPAVIN CURE...

the old reliable remedy for **Spavins, Ringbones, Splints, Curbs,** etc., and all forms of **Lameness.**

It is the most successful remedy ever discovered, as it is certain in its effects and **cures without a blemish, as it does not blister.**



East Millstone, N. J., Jan. 15, '98.

Gentlemen:—For the last ten years I have used Kendall's Spavin Cure with good success, and have **absolutely cured Spavins** after our best Veterinaries said nothing would cure but to have the horse fired. I wish you would send me your "Horse Book." Yours respectfully, E. S. ROGERS.

Such endorsements as the above are a guarantee of merit. **Price, $1; six for $5.** As a liniment for family use it has no equal. Ask your druggist for Kendall's Spavin Cure, also **"A Treatise on the Horse,"** the book free, or address

A Difficult Question.

ED. HOARD'S DAIRYMAN:—I see by the DAIRYMAN that you answer questions. Will you please tell me the place in the dairy business for a person that does not like to send any animal to the butcher. Have 9 cows, every one like a pet dog will come to me on the call of their names.

Fresno Co., Cal. DR. WM. B. MCA.

Let one doctor answer the other.

In his poem, Bitter Sweet, published in 1858, Dr. Holland described the home coming of children and grandchildren to celebrate the Puritan's holiday and the scenes and events connected therewith. Thanksgiving eve, Ruth, the daughter who orders the home in place of the mother who passed from earth a dozen years before, and David, the latest son-in-law, descend to the cellar for cider and apples and in their quest pass the barrel of beef, when Ruth says:

* * * * * * *

Pet of the pasture and stall—
Whitest and comeliest heifer,
Gentlest of all!
Oh, it seemed cruel to slay her!

* * * * * * *

And to her David makes answer:

Life evermore is fed by death,
In earth and sea and sky;
And, that a rose may breathe its breath
Something must die.

* * * * * * *

The milk-haired heifer's life must pass
That it may fill your own,
As passed the sweet life of the grass
She fed upon.

The power enslaved by yonder cask
Shall many burdens bear;
Shall nerve the toiler at his task,
The soul at prayer.

From lowly woe springs lordly joy;
From humbler good, diviner;
The greater life must aye destroy
And drink the minor.

* * * * * * *

New York Dairying and the City Milk Supply.

ED. HOARD'S DAIRYMAN:—There is a new stir in the grazing districts of New York State that is going to be watched with great interest by every person who feels as keenly as most of us do, the fact that the eastern farmer is still lagging behind his brother in the west. We are not lifting our mortgages at a rate that is alarming the banker and private money lender. In fact, we are just beginning to feel the tide of better days, that has already been rolling in on the west for two or three years. Some sections are not feeling it to any extent yet, if at all. To say that such communities read of western farm prosperity with a great degree of uneasiness is stating only a part of the fact.

The new opening is milk. It goes to the big cities, which are each year extending their lines further and further into the interior for supplies. It is no secret that the better informed farmer has for sometime been doubtful as to the possibility of making much profit on butter at 17 cents a pound or thereabouts. He felt that such prices were anything but an assurance of mortgage lifting, and as he saw that more and more attention was paid to dairying he came to believe that prices would not be likely to advance right away. So he has hesitated over the problem, and now there is promise of a solution in a new direction.

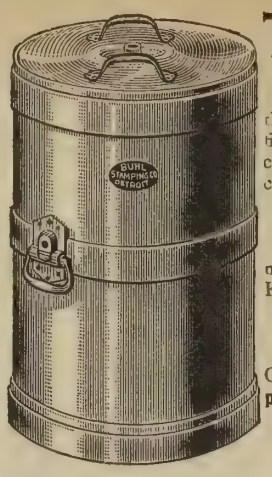
At the State Dairymen's annual exhibition in Cortland last month it was a matter of general disappointment to find that the exhibits of butter and cheese were so much fewer than they had been at Gouverneur the previous year, but the explanation was an easy matter. Gouverneur is the center of a big creamery district and alone sent in over 200 samples for competition, while Cortland sells milk and was represented by only six exhibits. But Cortland is more than 200 miles from New York, yet it is apparently finding that milk brings more money when shipped to New York, than when worked up at home. The western part of the state of course sells milk largely in Buffalo, Rochester and other cities within easy reach. The business is constantly growing and while we do not generally look on it as the highest grade of dairying it appears likely to be a great factor in the business in future and if it will assume its full share of the responsibility of helping the state farmer to his feet, there ought to be no objection to it.

When I paid my last visit to my old home, in one of the upper Susquehanna river valleys of the state, and it was less than two years ago, I found the farmers there pretty nearly as poor as ever and inclined to be discouraged. I am informed now that there is a stir there as well as further west in the state. They have felt the effect of a greater demand for milk from New York, which is less than 150 miles away.

In a conversation with a silo manufacturer, who declares that the prosperity of the farming districts can hereafter be guaged by the number of silos put up, I learned that the interior of the state is everywhere wider awake in regard to dairying, than ever before. The sale of silos is doubling every year, and promises to do so for some time yet. This means, first, that the farmer has been getting a little surplus money for making improvements, and also that he is waking up, however slowly, on the general subject of dairying.

"When you go home next time," said my informant, "you will find that there is a change there for the better. The courage of the people is better and the credit is better, too. The New York milk trade is doing it, and it is going to redeem the hill farmer. It has already begun to do so. That is why our business flourishes more than it used to. Why, we are working Vermont with good results, and the opportunities there are not generally as good for dairying as they are in New York state."

Buffalo is advancing the price of milk and, thanks to the city Board of Health, is now getting a fairly good quality, in place of the severely watered article that prevailed before the city took the matter up. There is a proposition to district the city and set up a general "trust," I suppose we shall have to call it, in order to save each individual dealer from covering the whole city to reach his customers. That is in the right direction in some respects, but may be going too far in others. What I wish to note is, merely, that there is a general awakening on the the subject over the state.



While Western New York is still too good a grain district to be at its best in dairying, it can show some excellent results in the latter business, and that every time a fair trial is made. JOHN CHAMBERLAIN

Erie Co., N. Y.

DR. PIERCE'S FAVORITE PRESCRIPTION

"I had been a sufferer for many years from nervousness with all its symptoms and complications," writes Mrs. O. N. Fisher, 1861 Lexington Ave., New York, N. Y. "I was constantly going to see a physician or purchasing medicine. In the spring of 1897 my husband induced me to try Dr. Pierce's Favorite Prescription. After taking one bottle and following your advice I was so encouraged that I took five more bottles, and then stopped for several weeks as I felt so much better, but still I was not *completely cured*. I commenced taking it again and felt that I was improving faster than at first. I am not now cross and irritable, and I have a good color in my face; have also gained about ten pounds in weight and *one thousand pounds of comfort*, for I am a new woman once more and your advice and your 'Favorite Prescription' is the cause of it, coupled with the 'Pleasant Pellets' which are not to be dispensed with. I took eight bottles of the 'Prescription' the last time, making fourteen in all, and will not take any more unless you so advise, for I do not see as I need it."

makes weak women STRONG, sick women WELL.

The Best Factory Cans.

The strong points of the Buhl Milk Cans are their great strength, heavy coating of pure tin, and fine finish. They do not rust like common cans, have no crevices inside, will not leak, and need no repairs. No other cans have the Genuine Heisey Side Handles.

Look for the Milk Can Trademark.

This can has 3 welded, tinned, wrought-iron hoops, tinned malleable side handles, and heavy XXXX genuine Cookley K cylinders. Capacity, 15, 20, 30, 40, and 50 gallons.

Refuse Imitations.

We make all patterns and sizes of Factory and R. R. Milk Cans, and will gladly mail you our hand-book free. **We make prompt shipment.**

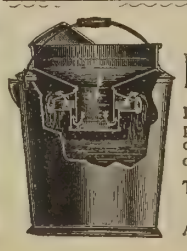
SOLE MANUFACTURERS. Cattaraugus, N. Y.

AERATION

Why do STAR Milk Aerators and Coolers AERATE Milk as well as COOL IT?

Because, as the milk becomes cold so does the water used for cooling become warm; this warm water is at the top of the machine where the warm milk strikes it first, the milk spread out in a thin film exposed to the air, flows downward as the water flows upward, the milk gradually coming in contact with colder water until it drops off the cooling surface where the fresh water is slowly entering, into a collecting trough. The milk is thus subjected to a gradual and continuous reduction of temperature while exposed to the air, the evaporation necessarily taking place under this condition forces out the animal heat and with it the objectionable odors.



This result cannot be accomplished by chilling the milk as would be the case if brought in contact with an ice cold surface.

For thorough aeration a gradual and continuous reduction of temperature is absolutely required; this result can only be produced by a machine that has a long flow for the milk and also for the water; it is essential that the water should become warmed so that the milk is gradually cooled during the process of aeration. In the smallest size STAR AERATORS AND COOLERS the film of milk has a downward flow of at least forty (40) inches.

JOHN A. SALZER SEED CO. LACROSSE, WIS

IT HOLDS UP YOUR HAT

Don't you remember how your father used to test his grass and grain in this way? When it held up the hat it was always regarded as being a satisfactory and profitable "stand."

...THIS...

BROME GRASS

Surpasses Timothy in nutrition. Outyields Alfalfa. Yields four to five tons per acre. One sowing lasts 12 years. Grows well in light soil, or wet swampy land. Has no equal for arid regions. Drouth will not kill it. Animals enjoy it green or dry. Gives as much food in one month as Alfalfa does in three. Greatest boon ever offered as it thrives in any climate, under any conditions and makes productive what would otherwise be waste land. It is doubtful if the supply of seed this year will meet the demand, so great is the call already from States where hay is the essential crop. Price: Grade A—1 lb., 30c; 3 lbs., 85c, prepaid. 18 lbs. (enough for one acre) $3.60; 100 lbs., $18.00. Send for mammoth descriptive catalogue with treatise on cultivation and comparative food values of Brome Grass and Timothy. Address, **L. L. MAY & CO., Seed Growers, ST. PAUL, MINN.**

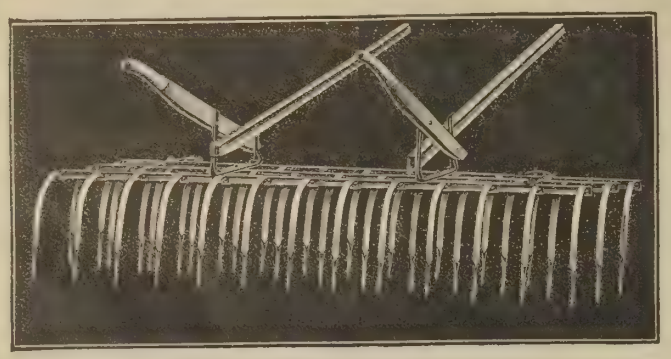
Protection
FOR PLANTERS

Seed is the planter's ammunition, and good seed is just as important to the man behind the plow as good ammunition is to the "man behind the gun."

Out 1900 Catalogue of
EVERYTHING FOR THE GARDEN
is a 190-page book, 9x11 inches, containing over 700 engravings and 6 superb colored plates of Seeds and Plants—a perfect mine of information on garden topics. To give our Catalogue the largest possible distribution, we make the following liberal offer:

EVERY EMPTY ENVELOPE
Counts as Cash.

To every one who will state where this advertisement was seen, and who encloses us **10 cents** (in stamps), we will mail the Catalogue, and also send, **free of charge,** our famous **50-cent "Harvest" Collection** of seeds, containing one packet each of New Large-flowering Sweet Peas, New Giant Pansy, New Giant Comet Asters, White Plume Celery, French Breakfast Radish and New Freedom Tomato, in a **red envelope,** which when emptied and returned will be **accepted as a 25-cent cash payment** on any order of goods selected from Catalogue to the amount of $1.00 and upward.



PETER HENDERSON & CO.,
35 AND 37 CORTLANDT ST., NEW YORK.

Hallock's Success Anti-Clog Weeder

More than 40,000 of our Weeders now in use. Does this mean anything? We expect our sales in the year 1900 alone to crowd these figures. Why? Listen, please:—Material used in manufacture of implements has advanced fully 100 per cent. Your dealer will ask you largely advanced prices for all implements. If you doubt this, call on him.

TAKE NOTICE---Hallock's Success Weeder will be sold at the same old prices—not one cent advance.

More than 7,000,000 farmers in the United States, every one of which will own a Weeder in the next few years. Practically every one of them would buy in the year 1900 if they knew as much about the value of our Weeder as the 40,000 who now own one. We have decided that we may just as well have practically all of the "Weeder trade." To secure it, we have decided on prices that are bound to bring it. Just write and see if you do not think so.

We Sound a Note of Warning

Under U. S. patent No. 600,782, issued on March 15, 1898, we have the exclusive right to make a Weeder having teeth substantially round at lower end and a flat spring-yielding upper portion. This style of tooth gives our Weeder great superiority over all round tooth weeders and has caused it to become immensely popular. Farmers demanded of their dealers a weeder having such teeth, and the dealer in turn demanded them of the manufacturer. This led different manufacturers to assume the risk of using a similar tooth. Therefore, we hereby notify manufacturers, dealers and farmers that we have already brought suit against several and will promptly and vigorously prosecute all similar offenders.

Let us repeat:—It is an absolute fact that the price of all implements has advanced from 25 per cent to 50 per cent., but Hallock's celebrated Success Weeder will be sold at the old prices. Trade always follows where our Weeder is introduced, therefore, to get this trade, we will quote **Special Price** to first purchaser. Remember, we are the Weeder people and we have the price that sells.

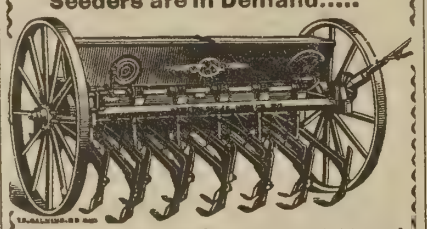
D. Y. HALLOCK & SONS, Box 812, York, Pa.

"OHIO" SELF FEED ENSILAGE CUTTER

Cuts 33⅓ % more than regular machine.

Saves 75% in time.

Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids re-cutting, binding, choking, &c. The cut shows



NEW METAL STRIP SWIVEL CARRIER.

Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue **FREE.** Prof. Woll's "A Book on Silage" 10c.

THE SILVER M'F'G CO., Salem, Ohio.

THE BADGER

Is Known Wherever the Best Seeders are in Demand.....

As a proof of its durability we can point to seeders **sold 21 years ago still doing good work.** It has an effective spring hoe which automatically adjusts itself to rough and uneven ground, a continuous steel frame, steel drag bars and every practical improvement essential to **ease of operation, strength, durability and effective working qualities.**

The Kind That Keeps New.

LOOK THE BEST

WEAR THE BEST

It's a nice thing to have a new creamery outfit. Everything looks spink and span,—there are no leaks in the vats, the machinery works nicely, and it's easier work running the creamery, also the butter is of better quality. If everything about the creamery or dairy would only "keep new" it would be fine. You think that is an impossibility, but perhaps it's not. If you buy a first water diamond ring it will be worth as much in twenty-five years as it is now, but if it is only a glass ring, while it may look almost as well on the start, the facets will soon get dull and the ring will be worthless.

We are making some first water Creamery Vats and Outfits—The Kind that Keeps New. They cost us a little more to manufacture, for there is better material and workmanship to pay for. However, the cost is but little more, as we save through buying material and manufacturing in large quantities and with superior organization. But it's worth double to have vats and machinery that "keep new" double as long, so we claim to be and are, by far the cheapest furnishers in the business, quality considered.

A Sharples "A" grade vat is made of fine, hard, durable, handsome, cypress selected for the purpose. It is lined with heavy imported tin sheets of the best quality and large size to avoid seams. The lining is carefully braced to prevent bulging from water pressure underneath or any undue strain. They are finished with the best $5.co per gallon varnish (the kind that will "keep new") and show the natural grain of the wood. There is no chance to cover up knot holes or defective lumber, so only the finest grade can be used. The vats look worth double the money when they *are new* and they "keep new" twice as long but they cost very little if any more than the regular vats sold by others.

We take the same care with our other goods that we do with our vats and all the goods we turn out are recognized by those who know as being the best that money can buy. We wish to mention a few of our specialties that are

NOT CONTROLLED BY THE TRUST.

The Standard Babcock Tester.
The Improved Haney Cream Carrier.

THE SHARPLES CO.,
28, 30 and 32 So. Canal St., Chicago, Illinois.
Factories at West Chester, Pa., and Dubuque, Iowa.

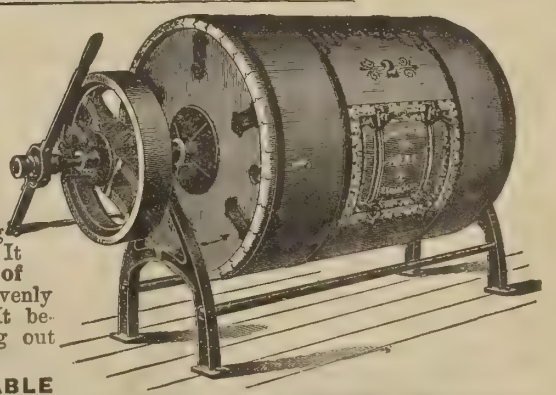
WHY YOU SHOULD USE A

Sharples Tubular Separator

BECAUSE it will enable you to secure more profit from the same amount of milk than you can possibly secure in any other way—and profit is what you want.

The Sharples Tubular Separator does this because it produces a finer quality of smooth, velvety, commercial cream, of greater churnability than any other separator, and of any desired consistency, regulated in a moment by the turn of a screw. For proof, ask any user of a Sharples Tubular Separator.

The Sharples Tubular will produce more butter from a given quantity of milk, other things being equal, than any other separator made. We are willing to guarantee this, and in case of failure the machine comes back.



The Sharples Tubular is **simple, safe, durable and convenient,** not standing out strong in one particular alone, but superior in each particular as you take them up one by one. You will agree with us as to its simplicity as soon as you see it. As to safety, 20,000 Sharples Separators are in use—without a single accident is the record, unequalled by any other separator. For durability, we point to the fact that the first Tubular ever sold is running to-day, without having cost a cent for repairs. For convenience in handling and washing: The bowl of the largest machine complete weighs less than 30 lbs. and has but three pieces. For further important points

Send for Catalogue No. 46.

NO PARDON.

Since the fine and imprisonment of Joseph Wilkins and Howard Butler for violation of the national oleo laws, a strong and determined effort has been made by the oleo interests to have them pardoned. All efforts of the kind have failed, and they will have to serve out their sentence. The opinion of Attorney-General Griggs places the men where they belong—among the common herd of law breakers. Mr. Griggs says:

"It is obvious that the business in which Wilkins was engaged must have been one of great profit, otherwise he could not have afforded to make the very large payments in compromise which he did make or offered to make. That he was aware of the fraudulent and dishonorable nature of the business in which he was persistently engaged, appears from his own statement, made in a letter addressed to the Commissioner of Internal Revenue, Oct. 31, 1893. It is absolutely clear that for such a persistent violator of the law something more than a money penalty was essential. The sentence of imprisonment imposed in this case was peremptorily required by the circumstances. Nor can I say that the sentence was anything but moderate. I do not think that the sentences should be interfered with."

DOES IT PAY TO FEED BRAN AT $15 A TON?

This is a very pertinent question, and while some men of clear, quick judgment will answer in the affirmative, others will not and we believe they are in a great majority. The difficulty lies in the fact that there are so many farmers keeping cows, in whose mind one feed is just about the same as another.

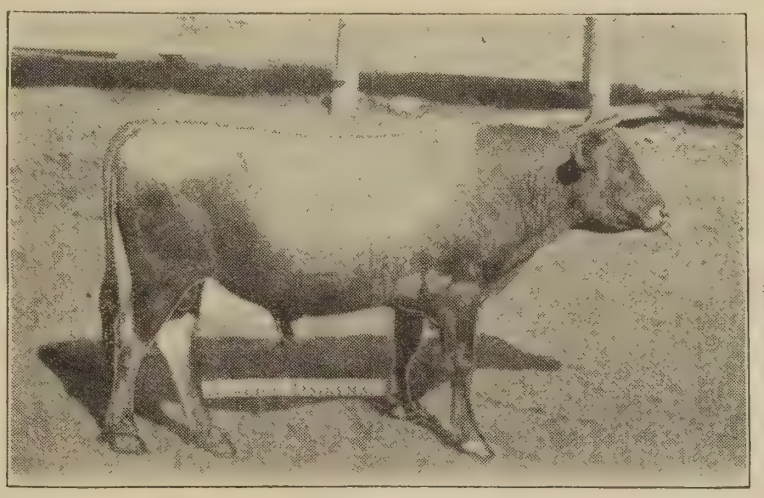
But few have got the idea down hard in their heads that a cow must have about so much protein every day, if she is going to give milk profitably. So they will feed oats and corn to excess and refuse to sell the oats and buy bran, when if they knew it they would make a good profit on the transaction.

W. J. Kennedy, of the University of Illinois, has been trying to solve the question in his own mind, and he writes the *Orange Judd Farmer* about his experience as follows:

"Does it pay to feed bran at $15 per ton? This question is one of the many problems that the dairy farmer has to solve at this season of the year. It was the one that I had to solve a few weeks ago when formulating our winter ration for the university dairy herd. It had occurred to me that $15 a ton was a very high price for bran, but I knew that we must supply the cow with a certain amount of digestible protein (2.5 lbs.) in her ration, in order to obtain good results at the milk pail, and that was our main object in feeding bran.

"Now in formulating a ration for the dairy cow, the greatest difficulty is to obtain a sufficient amount of digestible protein. The other ingredients are usually present in excess, but the protein is deficient. Thus in making a comparative estimate of the values of the different foods for dairy cattle, we figure on the protein content of the various foods. For illustration we say that two foods having the same amount of digestible protein are of equal value for feeding dairy cattle, but this statement sometimes needs a little modification, as some foods are much more palatable than others, consequently they are more valuable.

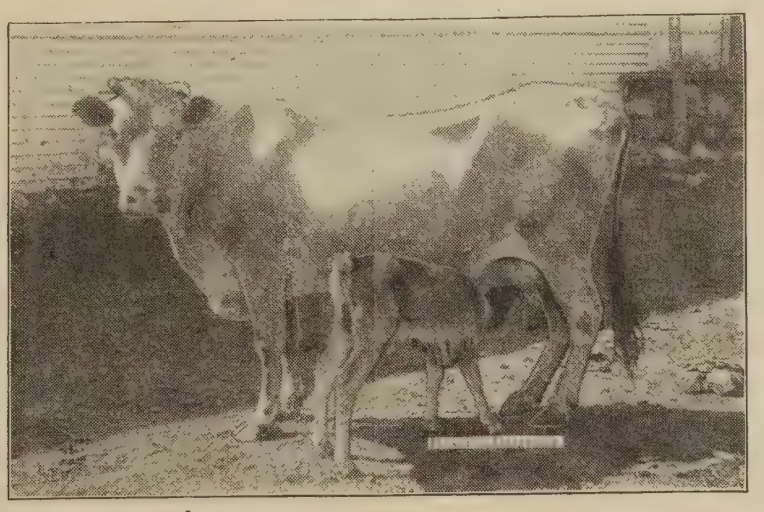
"I found that bran at $15 per ton furnished digestible protein at 6 cents per pound; also that when bran is $15 per ton, other foods are worth for feeding dairy cows as follows: Oats, 18½c per bushel; clover hay, $7.50 per ton; corn stover, $2 per ton; corn fodder, $3 per ton; corn silage, $1.08 per ton; gluten meal, $30.96 per ton; oil meal, $33.60 per ton. On further investigation of the different foods I decided to feed gluten meal instead of bran. We can purchase our gluten meal for less than $20 per ton, delivered at our railroad station. By feeding gluten meal we are getting our digestible protein for less than 4 cents per pound, thus reducing the cost of our ration considerably. Formerly we fed 6 pounds of bran along with other grain feed to our cows, but in making the change we substituted 3 pounds of gluten meal for the 6 pounds of bran, as one pound of gluten meal contains as much protein as two pounds of bran.



"Since feeding the gluten meal, our cows have not only held their own, as we hoped they would, but have increased their flow of milk from 1 to 3 pounds per cow. Thus we consider ourselves justified in making the statement that the gluten meal is a very much cheaper source from which to obtain protein than bran at the present prices of both feed stuffs."

Dairying in South Dakota.

The Record of a Profitable Herd.



ED. HOARD'S DAIRYMAN:—In 1898 our 16 cows averaged 6,000 lbs. of milk, which yielded 301 lbs. 5 ounces of butter. This, with stock sold and pork raised on skim milk, brought us in a net income per cow of $62.50, after deducting our expenses for feed. We thought we had done very well, but were determined to try and do better in 1899. We started in by culling out some of our poorer and oldest cows, and added three cows by purchase and four heifers of our own raising, we still just keeping the number up to 16 cows. We use a registered Short-horn bull, or in other words we believe the dual-purpose cow the best for the South Dakota farmer.

To do justice to our herd we should only figure the milk from 14 cows, as in making the change we were at times milking not more than twelve.

JERSEY BULL, CHROMO 3rd, OF HOOD FARM.

Property of H. O. WALKER, Merrimac, Mass.

A DAIRY GRADE COW.

Property of H. O. WALKER, Merrimac, Mass.

We make a rule not to keep a cow that will not yield at least 40 lbs. of 4% milk a day, when fresh. We feed a balanced ration. When I figured up the results at 14 cows, it almost took my breath away. I thought, what will the reader say that has cows that only give 125 lbs. of butter a year; the man that has not the courage to feed intelligently and liberally? So I figure in the 16 cows from the fact that my milk yield for the first 15 days in this month exceeded the same time last year by over 2,000 lbs. I consider I have a much better business herd than one year ago. So, as I have the same number, 40 head in all, including the young stock, and as they invoice about the same, I will give the cows credit for all cash received and charge them with all expenses, except labor.

I find dairy farming very profitable in South Dakota. All kinds of feed are cheap and nutritious. The climate is healthy and there is something invigorating in the air, to man and beast. Land is cheap, and feed in abundance. Here at De Smet we have the largest creamery in the state, paying out over $3,000 each month for milk to the farmers, and there are, altogether, ten creameries in full operation in this, Kingsbury County.

Hay from native grasses can be put in stack at 75 cents per ton, and there are millions of tons go to waste every year. One remarkable thing about our grass is that it cures in the fall standing, and is good, nutritious feed all winter for young stock. We are having a very mild winter here; up to date only four inches of snow has fallen. But I am getting away from man's best friend, the cow.

My total milk yield was 101,477 lbs., which yielded 5077 lbs. butter, our average test being 4.35. This milk brought at creamery, $735.54; or 6,342 lbs. of milk and 317 lbs. 5 ounces butter, making $45.97 for each cow, at a total cost for feed of 4¾ cents per pound for butter.

Besides the calves, we raised on skim milk $76.00 worth of pork, and have sold in cows and young stock $755.00; this makes the gross receipts $1,566.54, or $97.90 for each cow. Now, we have paid out $103.00 for cows and $240.00 for feed, leaving the net balance, after deducting all expenses but labor, $1223.54, or $76.47 for each cow.

Our winter feed is one bundle of oats and 5 lbs. bran, and 5 lbs. shorts, and all the good prairie hay they will eat, to each cow per day. The scales and lead pencil are frequently used in our stable. This, with liberal, intelligent feeding, kindness and regular attention to the cows, makes dairy farming very pleasant and profitable in the "Cream County of South Dakota."

I want to confess that HOARD'S DAIRYMAN should get credit for my success.

JOHN ARMSTRONG.

De Smet, So. Dak.

Samples From Massachusetts.

ED. HOARD'S DAIRYMAN:—Enclosed I send for your inspection a snap shot of my bull, Chromo 3rd of Hood Farm, also of a rather remarkable old cow. You ought to give the bull a good look over, for HOARD'S DAIRYMAN is responsible for my paying a good round sum for him. The picture is hardly a fair representation of him, as the kodak man was afraid of him and took him through a window several feet above him. One would judge him to be light in color, with one white leg, whereas he is of a rich dark color throughout. We call him a fine looking chap for a two-year-old.

The cow has given me five heifers, three of them in milk; the oldest two holding a first record, one of over 5,000, and the other one 6,000 pounds, while the third one finished her first year a few days since with a record of 7,380 lbs. of milk. All test five per cent or over. It is needless to say that the day-old baby by her side has not made a record yet.

H. O. WALKER.

Merrimac, Mass.

Scales For Weighing Milk.

I wish to purchase scales suitable for weighing the milk of each cow at time of milking. How should a scale be graduated to make it most convenient?

Could you or some of the DAIRYMAN readers tell me where I could get a first-class scale for this purpose? I see none advertised in the DAIRYMAN at present. G. W. D.

Deer Lodge, Montana.

A scale for the above purpose should be graduated so as to read pounds and tenths of pounds. Such division of the scale makes calculations much easier than when pounds and ounces are used. Scales so divided can be obtained of Cornish, Curtis & Greene Co., Fort Atkinson, Wis., and the Dairyman's Supply Co., Philadelphia, Pa.

Relative Value of Butter Fat and Butter.

D. C. B., Culbertson, Neb. asks how near the price of butter at Elgin should a creamery in Nebraska pay for fat where the daily receipts of milk are from 2,000 lbs. to 4,000 lbs?

For reply, we respectfully refer him to the figures presented at the Kansas Dairymen's Convention, which are published on page 1,038.

REMEMBER

That this is the best time of the year to induce your neighbors and friends to become readers of HOARD'S DAIRYMAN. Don't fail or forget to say a word to them. We want your help. Bear in mind that the club rate is three subscriptions for $2.00, four subscriptions for $2.50. Get up a club.

THE KANSAS DAIRY MEETING.

The DAIRYMAN is glad that the members of the Kansas Dairymen's Association have not followed the fashion in so many other State Associations, of ignoring the farmer as a milk producer and the foundation of the industry in their topics and discussions.

The late Kansas meeting was characterized by several very practical papers, which took hold of the real gist of the question in a forcible way. Among these was that of Prof. Otis on "Feeding and Developing the Kansas Dairy Cow".

Then, Prof. Cottrell led a "Patron's Class" in a very edifying and instructive manner. Secretary Coburn of the State Board of Agriculture, who is a host in the advancement of dairy knowledge in that state, gave a very interesting description of what he saw in a recent visit to the dairy farm of Geo. H. Ellis, of Newton, Mass.

Just as long as the Kansas Association keeps constantly to the fore, the growth and enlightenment of the man who owns the cows and produces the milk, so long will that association exist, as a living vital force for good in Kansas.

BE HONEST.

A friend in Maine sends us a newspaper clipping which gives an account of a little sharp practice in a creamery in that state. The creamery in question undertook to draw away the patrons of another creamery by offering as an inducement the payment of more money per pound for the butter realized. A patron was caught by the offer and made the change, but he did not notice any increase in his checks. He was a man who had learned to use his pencil, as all farmers should, and so he concluded to send one-half of his cream to one creamery and the balance to the other. He found that the creamery that gave the largest price per pound gave a test of 16 per cent and the other gave 19.

It is needless to say that the patron had no further use for such dishonest practices. The way to keep men honest is to be intelligent and know what you are about.

THE ILLINOIS FARMER ON TUBERCULOSIS.

The dairy farmers of Northern Illinois are organizing in opposition to the action of Governor Tanner and the Illinois State Board of Live Stock Commissioners in the efforts they are making for the further prosecution of tuberculin tests. They will resist these tests until, they say, it is satisfactorily demonstrated that tuberculosis may be transmitted from cattle to the human family by the use of milk.

It would seem as if such demonstration should be made beyond cavil before officials take into their hands such rigorous measures as the Illinois farmers complain of. Herds of cattle have been slaughtered, renters made bankrupt, so it is reported, and great damage done to the milk trade by the doings of the State Veterinarians, acting under the authority of the Governor's proclamation and the Live Stock Commissioners.

While it is just and proper for the farmers to listen with great respect to the conclusions of physicians, physiologists, and bacteriologists, it is right and proper for these latter gentlemen to remember that they have not yet clearly proved their case. And that should be done before they ask any man to sacrifice his property, as is often done.

More than this, the tuberculin test is simply a diagnostic concerning the presence of tuberculous matter in the system of the cow. It acts often with greatest certainty when there is the least amount of such matter in the system, and while it is merely embryonic. To say that such animals taint their milk with the infection of tuberculosis, is going beyond what can be proved, and the farmers have a right to call a halt.

THE BILL THE DAIRYMEN ARE SUPPORTING IN CONGRESS.

The dairy sentiment East, West and South has united in asking of Congress to enact the following bill, which was introduced Dec. 12, 1899, by Mr. Grout of Vermont. This bill embodies the several bills introduced by Mr. Davidson, of Wisconsin. Mr. Tawney, of Minnesota, with the added feature of a provision in the first section for complete control by the states over all substitutes of butter and cheese when imported therein.

The National Dairy Union is asking the friends of pure food every where, consumers as well as producers, to write their Congressmen and Senators in support of the following bill:

A BILL.

To make oleomargarine and other imitation dairy products subject to the laws of the State or Territory into which they are transported, and to change the tax on oleomargarine.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all articles known as oleomargarine, butterine, imitation butter, or imitation cheese, or any substance in the semblance of butter or cheese not the usual product of the dairy and not made exclusively of pure and unadulterated milk or cream, transported into any State or Territory, and remaining therein for use, consumption, sale, or storage therein, shall, upon the arrival within the limits of such State or Territory, be subject to the operation and effect of the laws of such State or Territory, enacted in the exercise of its police powers, to the same extent and in the same manner as though such articles or substances had been produced in such State or Territory, and shall not be exempt therefrom by reason of being introduced therein in original packages or otherwise: *Provided*, That nothing in this Act shall be construed to permit any State to forbid the manufacture or sale of oleomargarine in a separate and distinct form and in such manner as will advise the consumer of its real character free from coloration or ingredient that causes it to look like butter.

SEC. 2. That after the passage of this Act the tax upon oleomargarine as prescribed in section eight of the Act approved August second, eighteen hundred and eighty-six, and entitled "An Act defining butter, also imposing a tax upon and regulating the manufacture, sale, importation, and exportation of oleomargarine," shall be one-fourth of one cent per pound when the same is not colored in imitation of butter; but when colored in imitation of butter the tax to be paid by the manufacturer shall be ten cents per pound, to be levied and collected in accordance with the provisions of said Act.

OLEOMARGARINE SHIPPED.

Statement of Amount Sent into the Several States.

In response to the resolution adopted by the House of Representatives, offered by Congressman Tawney, of Minnesota, calling upon the Secretary of the Treasury for information as to the amount of oleomargarine shipped into the several states during the fiscal year ending June 30, 1899, the following is the answer of Secretary Gage:

AMOUNT BY STATES.

The total amount of oleomargarine shipped during the year was 79,695,744 pounds. Of this amount 816,848 pounds were shipped into the District of Columbia; 1,791,950 pounds distributed in Maryland and 1,159,400 pounds distributed in Virginia.

Illinois is the banner state, 18,638,921 pounds of oleomargarine being distributed. Pennsylvania comes next with 11,433,341 pounds, Ohio 8,830,969 pounds and New Jersey 5,875,975 pounds. New York shows only 222,788 pounds, while West Virginia received 1,206,865 pounds. Other distributions are shown as follows: Indiana, 3,923,228 pounds; Colorado, 1,123,537 pounds; Kansas, 1,658 544 pounds; Kentucky, 1,490,577 pounds; Louisiana, 1,043,502 pounds; Massachusetts, 2,083,889 pounds; Michigan, 2,092,521 pounds; Minnesota, 1,343,865 pounds; Missouri, 3,133,313 pounds; Nebraska, 1,024,985 pounds; Rhode Island, 3,594,984 pounds; Texas, 1,518,264 pounds; West Virginia, 1,206,865 pounds.

Nevada received the smallest amount, 625 pounds, while far-off Alaska got 18,080 pounds; Alabama, 226,053 pounds; Arkansas, 380.389 pounds; Arizona, 78,767 pounds; California, 74,923 pounds; Connecticut, 134,255 pounds; Delaware, 40,475 pounds; Florida, 590,225 pounds; Georgia, 495,004 pounds; Idaho, 58,224 pounds; Indian territory, 152 278 pounds; Iowa, 79,922 pounds; Maine, 102,274 pounds; Mississippi, 104,622 pounds; Montana, 446,022 pounds; New Hampshire, 455,583 pounds; New Mexico, 115,850 pounds; North Carolina, 110,244 pounds; North Dakota, 7,710 pounds; Oklahoma, 117,398 pounds; Oregon, 41,250 pounds; South Carolina, 258,159 pounds; South Dakota, 55,432 pounds; Tennessee, 714,640 pounds; Utah, 8,450 pounds; Vermont, 2,990 pounds; Washington, 63,345 pounds; Wisconsin, 714,742 pounds; Wyoming, 39,547 pounds.

The above showing is a most significant comment in several ways:

1. Thirty-two of the states named have strict laws against the sale of the stuff in imitation of yellow butter. We can now see clearly what a huge conspiracy is formed by this oleo combine to violate and break down all state laws interfering with their trade in making and selling counterfeit butter. It is, in fact, a combination of immense capital to override law and order that they may thrive on unlawful and dishonest gains. It is a conspiracy against the lawful authority of the states, against the farmer and the consumer.

2. It shows conclusively the need of national legislation such as is provided in the Grout bill, to set this law breaking and counterfeiting combine back on its haunches, and teach it and all the people the meaning of such dangerous and revolutionary conduct.

3. It ought to rouse every lover of honest government, honest food products, and every honest hater of counterfeiting, whether he be farmer, consumer, or what not, in a determined expression of his ideas to his members of Congress in both the House and Senate.

Let us suggest: Buy twenty cents worth of postal cards. Send one to your Congressman and one to each of your United States Senators, asking them to support a measure containing the provisions found in the Grout bill, known by number as H. R. 3717, which is now before the House

Then use the balance of the cards in writing to your friends in other states, urging them to write their Congressmen and Senators letters containing the same demand. In this way every voter will multiply his influence twenty-two times. Now is the accepted time to do this work. Fire in the postal cards; let Congress and the National Administration see and feel the influence of public sentiment against this unholy conspiracy to defraud the consumer and destroy one of the greatest branches of American agriculture. Don't delay!

SCIENTIFIC CHURNING.

A few weeks since we published a selection from a patent churn circular, in which attention was called to the style of dairy science(?) which was used to separate the unwary dairyman from his money. Now we give another sample of dairy wisdom on the same subject. The first circular claimed that the churn took all the casein out; this last one holds that it is a benefit to leave the casein in. You pay your money and take your choice on this point, but don't pay it for a machine that requires such nonsense to show its value:

"We have succeeded in getting a machine that works on purely scientific principles. It creates three separate and distinct currents in the milk, which causes a concussion that is unknown in other styles of churns, thereby separating the solids from the liquids without breaking the globule that encases the butter fat, adding to the weight of your butter whatever the weight of the casein and albumen is.

"Now, with the ordinary churn you allow your milk to become sour before churning, freeing the lactic acid in the milk, which rots the globule and makes it easily broken, and, of course, when it becomes broken is a part of the buttermilk and is thrown out.

"You readily see how much butter you lose in this operation, and have been losing all your life, and probably never knew it. That is not the important feature of the case. This lactic acid which is formed in the milk becomes a part of the butter, which you are entirely unable to wash out or remove; hence decomposition sets in, and in a very short time your butter becomes strong, or, in other words, smells bad."

The Onion Remedy for Lice.

ED. HOARD'S DAIRYMAN:—I see some one in this week's issue is asking a remedy for lice on cattle. About 8 years ago, I think it was in HOARD'S DAIRYMAN, some one gave this: Take an onion, cut in two and rub this on the animal until it is all worn away and in 4 or 5 days repeat.

I have tried quassia chips, tobacco, lamp oil, lard and carbolic acid and several other remedies. But the onion remedy is the only success. Don't fail to give this for a lice exterminator for cattle when ever any body asks for one and you will certainly get thanks for it. This may seem so simple that people may not try it but you urge them for a single trial; it is wonderful. J. F. W.

Parkersburg, W. V.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS Protein.	Carbohydrates.	Ether extract
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

A NEW YORK RATION.

A. W., Buskirks, N. Y., has silage and corn stover. Corn is worth 50 cents per bushel, and oats, 35 cents per bushel. He can buy bran at $19 per ton; gluten, $21; cotton seed meal, $26; his fresh cows are milking 30 lbs. per day, and he asks for a formula. We think the price of corn and oats excludes them from consideration. We therefore suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
12 lbs. stover	7.14	.20	3.89	.08
6 lbs. bran	5.29	.75	2.32	.18
2 lbs cotton seed meal	1.84	.74	.34	.17
Totals	22.19	2.08	10.75	.64

AN ILLINOIS RATION.

A. D. C., Amboy, Ill., requests a ration for 1000-lb.-cows from timothy hay, $10 per ton; corn stover, $5; shorts, $15; bran, $14; gluten feed, $18; corn and oats ground, $13.

Confining ourselves to feeds named we should select and try substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
12 lbs. timothy hay	10.42	.34	5.21	.17
10 lbs. stover	5.95	.17	3.24	.07
5 lbs bran	4.41	.63	1.93	15
5 lbs. gluten feed	4.61	1 02	2.42	.17
Totals	25.39	2.16	12.80	.56

We are somewhat sorry that we cannot substitute some oil meal for a part of the bran and gluten feed above, as it is our opinion that when one has neither silage nor roots a little oil meal is decidedly advantageous

AN OHIO FEEDING PROBLEM.

M. B., New Buffalo, O., writes that he put up a silo last fall, but his cows do not yield as much as he thinks they should. He says he is feeding them all the silage they will eat night and morning, and all the timothy hay they will eat at noon, and in addition gives them 4 quarts of bran in the morning and 3 quarts of corn meal in the evening. Gluten meal (?) is said to be worth $19 per ton and oil meal $30 per ton, and he asks which of these two would be the cheaper to combine with other feeds, and produce the greatest quantities of milk. His cows are grade Jerseys.

We do not think it is to be wondered at that these cows are not doing as well as their owner could wish. If we estimate that his cows eat 50 lbs. of silage night and morning and 5 lbs. of hay at noon, which is as much as they can reasonably be expected to consume, his ration would exhibit the following figures:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
50 lbs. silage	13.20	.65	7.00	.29
5 lbs. hay	4.34	.14	2.17	.07
2½ lbs. bran	2.20	.31	.97	.08
4½ lbs. corn	4.01	.36	3.00	.19
Totals	23.75	1.37	13.14	.63

The figures under the head of digestible protein tell the story. These cows are not receiving the raw material necessary to enable them to make satisfactory amounts of milk. It would require almost 3 lbs. of oil meal to bring this protein up to the minimum standard; but instead of using this, we would recommend him to substitute 4 lbs. of bran and 4 lbs. of gluten feed in the place of the grain he is now feeding. We specify these amounts in pounds, for the reason that there is no other way to insure that the cows are getting the proper quantity. We do not mean, of course, that this feed is to be weighed out every night and morning, but that the owner should fill his measure in his accustomed way, and find out just how much its contents weigh, whether these are bran or gluten feed or corn meal. The average weight of bran is 10 oz. per quart.

A NEW JERSEY RATION.

W R. H., Quinton, New Jersey, asks for a ration formula with 40 lbs. of silage per day; cob meal $13 per ton; coarse bran $19.50; gluten feed, 19.50; timothy hay, $16; clover hay, $20; corn meal $16; cotton seed meal $27; and corn stover.

The prices for timothy and clover hay seem to put these feeds beyond consideration. Gluten feed, if of good quality, is of course much cheaper than bran. We therefore suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
40 lbs. silage	10.65	.52	5.60	.28
10 lbs. stover	5.95	.17	3.24	.07
4 lbs. corn and cob meal	3.56	.26	2.52	.14
5 lbs. gluten feed	4.61	1.02	2.42	.15
Totals	24.68	1.97	13.78	.64

The protein in this formula is somewhat less than we would desire, basing this opinion upon the present weight of testimony. There is, however, some evidence, notably the experiences of Prof. Smith of the Michigan Agricultural College and Prof. Carlyle in Wisconsin, which tends to show that the amount above specified will answer a most excellent purpose.

ALABAMA QUERIES.

Mrs S. E. W., Mobile, Ala., has a herd of twenty-five fairly good, high-grade cows, but they are not profitable because feed is so high. Wheat bran is $18 per ton; cotton seed meal, $22 per ton; bolted meal, unbolted meal or cracked corn, which ever is best, each $18 per ton; cotton seed hulls, $7; and a middling quality of hay at $10 per ton. She adds that she can get wheat middlings and rice bran, but gives no price. She has tried the bran and the cows did not do well on it.

She also asks what to do with a calf that seems all right when born, then scours a little, seems to get weak and in a day or two dies, the mother being well and strong, and having had no physic. She also asks if it is proper to let a calf take the first milk from its mother, and stay with her for a few days.

She concludes her list of inquiries by stating that she wants to engage a man to work for her. He must be honest, upright, competent to sell milk and make money for himself and her.

To the first inquiry we answer, that a very middling quality of hay is liable to be much cheaper at $10 per ton than cotton seed hulls at $7. We cannot understand why the rice bran did not give satisfaction if it was of good quality. If she does not want to try that again, we would recommend her to mix wheat bran, ground corn and cotton seed meal equal parts by weight, and give her cows from 6 to 10 and possibly 12 lbs. of this mixture per day, of course graduating the amount for each cow by that particular cow's ability to respond. Add to this all the hay each cow will eat without wasting.

The second inquiry presents a more serious problem. The first thing to do is to thoroughly clean and disinfect the lying in quarters of the cows, or, otherwise, abandon those now used, and give them entirely fresh clean quarters for that purpose. It is true in all cases and particularly in cases of this character, that prevention holds to cure about the ratio of gold to silver.

We think it important that the calf should have the first milk (*colostrum*) from its mother. This is a wise provision of nature, and cannot be improved upon by man. We know that there are many successful breeders and dairymen who practice to the contrary, but we cannot believe that it is the best way. At all events, we leave the new born calf with its mother two or three days, and we think we have been, at least, fairly successful in raising them. It is true that we have had now and then a case of scours which was similar to the case reported by Mrs. S. E. W., but the thorough cleaning and disinfecting of the lying-in quarters has almost always proved effective. If we had at the present time a calf afflicted in this way, we should be disposed to try the remedy mentioned on page 1024, and might possibly be tempted to add a teaspoonful or more of essence of ginger to the doses there specified. Ginger, as our friends in the south well know, is almost a sovereign remedy for bowel troubles which are the result of indigestion; acting as a stimulant and a tonic.

Our friend's last inquiry will probably give her more trouble than any of the others. The qualities she enumerates are seldom found in one individual, and when they are, that individual commands a very high salary.

However, we do not think she need despair of getting a fairly competent man, and the best way we know of to secure such a man is to make use of the advertising columns of this paper. State what you want clearly and definitely, and it will be very singular if a goodly number of replies are not received which will put you into communication with parties in all sections of the country.

AN OHIO RATION.

A new subscriber at Mt. Vernon, Ohio, wants to feed an economical ration with corn at 30 cents per bushel; oats, 25 cents per bushel; bran, $16 per ton; gluten meal, $20; clover hay, $9; corn fodder, 3 cents per bundle.

We should be disposed to try the following combination as the average allowance for the herd:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
4 lbs. ground corn	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	24.02	2 18	11.37	.63

He also asks if there is a better cow for dairy purposes than the Jersey and whose products will equal or excel hers in butter fat? It is with cows a good deal as it is with religion, every man thinks his particular brand is the best, and that others are hardly worthy of consideration, whereas as a matter of fact much more depends upon the individual than the particular church to which he belongs, or the particular breed in which a cow is classed.

A MAINE RATION.

P. W. R., Windsor, Me., has ensilage; corn meal, $20; gluten meal, $25; cotton seed meal, $28; shorts, $21. His cows are mostly full blooded Jerseys, weighing 800 to 900 lbs., and have been giving milk from two weeks to six months. He wants a suggestion for a balanced ration from these feeds.

Assuming that where shorts are to be had, bran is also to be obtained, we submit for his consideration the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
30 lbs. silage	7 92	.39	4.20	.20
10 lbs. timothy hay	8.63	.28	4.34	.14
2 lbs. gluten meal	1.84	.52	.87	.10
2 lbs. cotton seed meal	1.84	.74	.34	.17
3 lbs. bran	2.64	.38	1.16	.09
Totals	22.92	2.31	10.91	.70

If the bran cannot be had the next best thing would be to use the shorts.

He also asks at what time after calving would you expect a cow to do her best? We have observed with some surprise that a good many breeders seem to bring their cows up to a high test very soon after freshening, much sooner than we personally consider it prudent. Very many of the largest tests reported were made within from ten to twenty days after freshening. We have always held to the doctrine that a cow should be practically grain free at calving time, and that after two or three days grain may be fed again in limited amounts and gradually increared taking from twenty to thirty days to bring her to full feed. It has seemed to us that this is the order of nature, and by all means the safest method to pursue. But we have no facts or figures to warrant us in condemning the practice of others which brings the cows to full feed much sooner.

A NEW YORK FEEDING INQUIRY.

J. M. D., Wiscoy, N. Y., sending in his renewal for 1900, asks the following question: "Can we do better for a grain ration, with good timothy hay (mixed with some clover) and bright oat straw, than corn, oats and bran in equal parts, by weight?"

Very decidedly we answer his inquiry in the affirmative. We assume that his cows are receiving 15 lbs. of timothy hay and 5 lbs. of oat straw, and that they have been able to eat, in addition, not to exceed 10 lbs. of the grain mixture specified. Such a ration would exhibit the following figures:

	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
15 lbs. timothy hay	13.02	.42	6.51	.21
5 lbs. oat straw	4 54	.06	1.93	.04
10 lbs. grain mixture	8.87	.99	5.08	.38
Totals	26.43	1.47	13.52	.63

We have here, as in answer to M. B., New Buffalo, O., a deficiency in the amount of digestible protein. Compare the above with the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates.	Ether Extract
Hay and oat straw as above	17.56	.48	8.44	.25
4 lbs. bran	3.52	.50	1.54	.17
2 lbs. cotton seed meal	1.84	.74	.34	.12
2 lbs. gluten feed	1 84	.41	.97	.07
Totals	24.76	2.13	11.29	.61

This may cost more than what J. M. D. is now feeding, but if he has cows that are worthy to be kept at all, they will more than repay the added expense.

WHAT TO SOW WITH OATS.

J. O. V., Danville, Ind., has for some years now been sowing oats, mowing them close to the ground and curing for hay. He wants to know if it is advisable to sow peas or beans with the oats in the future.

Notwithstanding what our friend in Illinois

says in another column about his experience with oat and pea hay where his cows refused to eat the peas, we are disposed to recommend them. Sow the peas a week or so before the oats, plow them under and when the peas are fairly well sprouted, sow the oats, and cut both before the seed is matured, just about when the peas are right for eating.

If we lived in Indiana we should be disposed to try some of the cow peas of the south. We think these are to be the coming fodder even in the north, as soon as they become thoroughly acclimated. We should not, however, care to depend entirely on these cow peas, but for the balance of the land would use the common small Canada field peas.

A MICHIGAN RATION.

A subscriber at Climax, Mich., has bright shredded corn fodder, corn meal, oats, bran, $16 per ton; Diamond gluten meal, $17.50, and is now feeding all the corn stover his cows will eat twice a day, wheat straw at noon, 4 lbs. corn meal, 4 lbs. bran and 4 lbs. gluten feed per day.

We are not quite sure whether this man is using shredded corn fodder or shredded corn stover. In the former case, set out in tabular form, his ration would exhibit the following figures:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. corn fodder....	14.20	.74	8.08	.24
4 lbs. ground corn....	3.56	.32	2.67	.17
4 lbs. bran.....	3.52	.50	1.54	.12
4 lbs. gluten feed.....	3.56	.61	1.94	.14
Totals.....	24.84	2.17	14.23	.67

We incline to the opinion that if he would increase the bran and the gluten feed each by 1 lb. and drop out the corn altogether, his ration would cost less money and give him better results.

AN INDIANA RATION.

B. F. S., Wabash, Indiana, like a good many others, is a new subscriber, received the first copy of the paper and has become interested in the feeding questions. We are very glad to notice that this most important subject is receiving more and more attention every year, and for that matter, almost every day, for it is the question of questions. We do not subscribe to the theory sometimes advanced that breed is in the feed, but it is none the less true that the best breed is of little account unless it is accompanied with good feeding.

B. F. S. has clover hay at $8 per ton; corn stover at $0.10 per shock. Corn is worth 30 cents per bushel; oats, 25 cents per bushel; bran and shorts, $13 per ton.

We are very glad that he has this clover hay, for it is the best roughage a dairyman can have. It enables him to get along with a moderate amount of grain and that of the cheapest character. We suggest for a formula as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay.....	12.71	1.02	5.37	.26
10 lbs. corn stover....	5.95	.17	3.24	.07
6 lbs. bran.....	5.29	.75	2.32	.18
2 lbs. ground corn....	1.78	.16	1.33	.09
Totals.....	25.73	2.10	12.26	.60

BUTTER FAT AND BUTTER.

With milk testing 4% butter fat and butter at 25 cents per pound, how much per hundred do I get for my milk? Please give me the scale running both ways from this. Also what does a small farm dairy Babcock milk tester cost? The question I asked was not to include the cost of making, but how much money that grade of milk will bring me per hundred lbs. with butter at 25 cents per pound. J. E. C.

South Bend.

The theoretical and actual yield of 100 lbs. of 4% milk may vary somewhat widely from each other especially in the winter months, when the effect of dry feed and the advance in lactation make their influence felt. Four pounds of butter fat will make about 4.66 pounds of butter, which at 25 cents per pound will equal $1.165. In the creamery, the yield may be a little above or below this figure. Also from the above the cost of manufacture must be taken, which may be from 2 to 4 cents per pound.

The probable average yield of butter is calculated by adding 1/6 to the weight of butter fat in the milk.

A small Babcock tester will cost from $3.00 to $6.00 according to size and make.

A LECTURE WANTED.

There are a few subjects I wish you would give us a lecture on:—

1. How to feed a two-year-old heifer to develop her udder and milking capacities.
2. Your opinion about milking a cow right up to freshening time.
3. Your method of drying off cows, especially persistent milkers.
4. Is there any book published on developing heifers.

I will soon send you a photo of a granddaughter of Eurotissima, that with good feed, and HOARD'S DAIRYMAN to read, has given 9,000 pounds of milk and 440 pounds butter, as a two-year-old. C. I. H.

Nunda, N. Y.

Where one has a two-year-old heifer that with her first calf makes a record of 9,000 lbs. of milk and 440 lbs. of butter the indications are that he does not need much of a lecture on how to develop heifers, and hence we postpone that inquiry indefinitely.

We should prefer as a rule not to have our cows milked continuously. We think it better that they should have a period of rest ranging from four to six weeks, and sometimes eight weeks, but our experience is that some cows have the milking habit so firmly intrenched that it is difficult and impossible to give them this rest without producing serious injury. When a cow persists in milking continuously, we think the best thing one can do is to let nature have her way in this respect, and try and compensate for the additional strain upon her system by giving more and better feed.

It is claimed by some careful observers among our acquaintances, that every cow has a period of two or three or four days, sometime before freshening, when the ordinary flow of milk materially lessens, and if by close watch, this is discovered and humored, the milk flow can be suppressed quite easily. But if this period passes unnoticed and milking is continued, then it is dangerous to force the cow to go dry.

The only way we know of to dry a cow is to first take away her milk producing feed. The regulation way is to milk first but once a day, and as soon as the cow becomes habituated to this, milk once in two days and so on, relieving the udder only when it becomes too tense.

We do not know that there is a book published that treats specifically of the matter of developing heifers.

A WISCONSIN RATION.

J. B, Calumetville, Wis., asks for a balanced and most economical ration for milch cows from the following feeds:

Corn stover at $3 per ton; mixed hay at $6; wheat bran, $13; ground oats, $15.50; ground corn, $11; malt sprouts, $10.

Assuming that the hay is clover and timothy, we would suggest as a minimum ration for fresh cows substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn stover ..	5.95	.17	3.24	.07
12 lbs. hay.....	10.24	.58	4.75	.19
3 lbs. sprouts.....	2.70	.56	1.11	.05
2 lbs. corn.....	1.78	.16	1.33	.09
5 lbs. bran.....	4.41	.63	1.93	.15
Totals.....	25.08	2.10	12.36	.55

This ought to suffice as an average for the entire herd.

PENNSYLVANIA RATIONS.

E. O. C., Hoblet, Pa., has good silage and mixed timothy, clover and red top hay, but both only in moderate amounts. Bran is worth $20 per ton; Buffalo gluten feed, $21; corn meal, $18; cotton seed meal, $30. He is now feeding about 20 lbs. of silage and 12 lbs. of hay per day, with 8 lbs. of a mixture composed of 200 lbs. of bran, 200 lbs. of Buffalo gluten feed, and 50 lbs. of cotton seed meal. His cows are grade Jerseys and Guernseys, and he has a full blooded Ayrshire bull at the head of the herd. His question is: Can the manner of feeding be improved?

As we estimate the ration now fed it contains 2.35 lbs. digestible protein, but only 10.85 lbs. carbohydrates and 0.6 of a pound of fat. In our judgment it would be better to reduce the protein somewhat, and increase the other elements in the ration. To accomplish this, we would add to the mixture from 100 to 200 lbs. of ground corn, and then feed, as now, 8 lbs. per day.

Another subscriber, from the same place, has corn silage, mixed timothy and clover hay at $10 per ton; gluten meal, $21; wheat bran, $20; cotton seed meal, $30; buckwheat shorts, $16; corn meal, $18. His cows are high grade Jerseys, fresh in milk, weighing from 800 to 1,000 lbs. each.

If his cows have the proper dairy temperament, we think it would pay him to feed on an average as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage.....	7.92	.39	4.20	.21
10 lbs. hay.....	8.53	.48	3.96	.16
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
3 lbs. gluten feed.....	2.77	.61	1.45	.11
2 lbs. corn.....	1.78	.16	1.33	.09
Totals.....	24.49	2 52	12.28	.79

AN ONTARIO RATION.

A new subscriber from Toronto, Ontario, has become interested in the answers to the feeding inquiries, and desires that we submit a formula for him to try. He has mixed alsike clover and timothy hay; can buy bran at $14; shorts at $16; corn meal at $18; gluten meal, $18; and pea meal, $25.

We think here, as we did in answer to some other inquirer, that the gluten meal is misnamed, and is in fact gluten feed. On this assumption we submit the following formula for his consideration:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
18 lbs. mixed hay....	15.93	1.01	7.54	.27
3 lbs. bran.....	2.64	.38	1.16	.09
3 lbs. gluten feed.....	2.77	.61	1.45	.11
2 lbs ground corn....	1.78	.16	1.33	09
Totals.....	23.12	2.16	11.48	.56

LEAKING TEATS.

We would like to find something that will prevent a cow from losing her milk from one of her teats. Have heard that there were rubber tubes to be drawn over the teat for such purpose. F. G.

Union, Oregon.

These leaking teats are very troublesome things. Contraction at the point of teat is needed. It is to be made sore, a *little* only, and then healed up, and if then too much contracted, a dilating plug is needed to open it up again. A slight rubber band put on the end will help temporarily. It will stop the leakage, but will not cure.

A MARYLAND RATION.

T. B. C., Pikesville, Md, asks for a formula for a balanced ration for a good quality of milk from the following feeds: Corn stover, corn and cob meal and ground barley (all of which he has on the farm,) and can purchase wheat bran, cotton seed or linseed meal and gluten feed. His cows are grade Jerseys of average size, mostly fresh, stabled very comfortably, water abundant from a well in the barn yard. He says his supply of barley is limited, and wants to know what he should use in its place when that is exhausted. Timothy or clover hay is obtainable, but he would prefer to use corn stover as he has an abundance of it.

We think it advisable in this case, notwithstanding the abundance of corn stover, to use a limited amount of clover hay. A cow is not so unlike a man that she cannot appreciate a little variety in her daily allowance of feed. It is, of course, possible for a man to live upon bread alone, but under ordinary circumstances, this is neither profitable or desirable. We therefore suggest that he try substantially the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. stover.....	11.90	.34	6.48	.14
5 lbs. clover hay.....	4.24	.34	1.79	.09
4 lbs corn and cob meal	3.56	.26	2.52	.14
4 lbs barley.....	3.56	.35	2.62	.06
2 lbs. cotton seed meal.....	1.84	.74	.34	.17
Totals.....	25.10	2.03	13.75	.60

This formula is a trifle low both in digestible protein and in fat, but when the barley is gone if an equal amount of wheat bran is substituted for it, these particulars will be somewhat improved.

A MISSING ARTICLE.

I have each copy of your paper on file in the Emerson, commencing from Nov. 11th,

"One Year's Seeding, Nine Years' Weeding."

Neglected impurities in your blood will sow seeds of disease of which you may never get rid. If your blood is even the least bit impure, do not delay, but take Hood's Sarsaparilla at once. In this course there is safety; in delay there is danger.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

For the Baby

The fifty-cent size is just right for the baby. A little of it in the bottle three or four times a day will supply precisely the fat all thin babies need. If your baby does not gain in weight as fast as you would like, try

Scott's Emulsion

The result will please you. If the baby nurses, the mother should take the emulsion. It makes the baby's food richer and more abundant; only buy the dollar size—it's more economical.

Both mother and child will feel at once its strengthening, upbuilding and fat-producing properties.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

1898, to the present time. I had occasion for the first time to refer to your index, vol. 29, to find in relation to silos. The index tells me that on page 913 I will find what I wish to know. Now, I am unable to find this page and I have all the papers complete commencing from Nov. 11, 1898, page 785, to Feb. 3rd, '99, page 1030. I am also unable to place these papers so that they will record the pages regularly as they should do. Will you please explain? J. C. W.

Delavan, Wis.

Page 913, No. 45, Vol. 29, contains an article on "Silos, Building and Filling," which we suppose is the one you wish. You may have an imperfect paper. Examine the numbers of your paper and see if they are all there, also the pages in No. 45, and let us know if that number is incomplete.

AN OHIO RATION.

U. S. M., having subscribed for the DAIRYMAN and received his first copy, finds himself interested in the feeding problems, and therefore asks us for formulas suited to his condition. He has cows in all stages of lactation, some fresh last June and others in succeeding months and still others to be fresh very soon. He has excellent silage, clover hay and corn stover. Corn is worth 35 cents per bushel. He can buy bran at $15.50 per ton; gluten meal, $17.50 per ton. Oil meal is worth $25 per ton and oats 30 cents per bushel. He also inquires whether it will do any harm to give his bull a small feed of silage once a day.

It is, of course, utterly impracticable to set down different tables that will fit the cases of all these different cows. The judgment of the feeder must come in here, to apportion the amount of feed and (in a way) the character of the feed, and the requirements of each individual cow. The cow makes milk from the feed she eats, and it stands to reason that the cow producing 30 lbs. of milk requires more feed, but not three times as much, as the cow producing only 10 lbs., because there is the element of the maintenance of the body which comes in in both cases.

For fresh cows that are doing fairly well we would recommend that he try a combination substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
6 lbs clover hay	5.08	.41	2.15	.10
6 lbs. corn stover	3.57	.10	1.94	.04
4 lbs. corn	3.56	.32	2.67	.17
3 lbs. bran	2.64	.38	1.16	.09
3 lbs. gluten feed	2.77	.61	1.45	.11
Totals	25.54	2.21	13.57	.72

If in feeding as above, certain of the cows take on more flesh than is profitable, the indications are that they are receiving more feed than they can use to advantage. In that event, the first grain to be withheld would be corn. On the contrary, if feeding as above some of the cows milk down so as to reduce their flesh, the indications are that they should have more feed.

We do not think it advisable to feed service bulls any silage whatever.

BRICKS WITHOUT SAND.

During the Egyptian bondage the Israelites complained because they were compelled to make bricks without straw. That may have been a very proper complaint at that time, but now-a-days we dispense with straw and use sand in its place, and we find this sand a very necessary element in making a substantial and permanent article. Of course clay can be molded in the form of brick and laid up into walls, but such walls cannot stand, or in other respects answer the same purpose as walls made from brick containing a due admixture of well tempered clay and sand.

It is somewhat so in feeding milch cows. We may feed them with corn stover and timothy hay and corn and cob meal, which will seem to fill them up at first as well as though it were a better quality of feed, but such feed will not enable them to meet the requirements of the modern dairy farm.

A very successful manufacturer of butter and cheese in Calumet county asks us if it is possible to make out a balanced ration for milch cows from corn stover, timothy hay, bran, ground oats and corn?

The best that we could expect would be to stipulate for 12 lbs. of timothy, 10 lbs. of corn stover, and by using bran exclusively, which is the highest in protein, we have the following figures:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. stover	5.95	.17	3.24	.07
12 lbs. timothy	10.68	.34	5.21	.17
10 lbs. bran	8.81	1.26	3.86	.30
Totals	25.44	1.77	12.31	.54

Undoubtedly, this would suffice for cows giving a limited amount of milk, but for good cows, such cows as a dairyman ought to have, we are decidedly of the opinion that such a ration would be too low, both in protein and digestible fat, and that it would pay, instead of using so much bran, to buy some gluten feed, and even some linseed oil meal, and then feed about 4 lbs. of bran, 1 lb. of gluten feed, and from 1 to 2 lbs. of oil meal.

AN IOWA RATION.

G. V. F., Waterloo, Iowa, in behalf of his patrons asks for ration formulas with timothy hay worth $7; oat straw, $2.50; oats, 20 cents; corn, 25 cents; oil meal, $27; bran, $11; gluten feed, $17. It appears that some of his patrons have only timothy hay for roughage; others only shredded corn stover, and others desire to mix oat straw and timothy hay in equal parts.

For ration with timothy hay we suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs timothy	17.36	.56	8.68	.28
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.82	1.94	.14
1 lb. oil meal	.91	.29	.33	.07
Totals	25.88	2.17	12.49	.61

When shredded corn stover is substituted for the timothy, or the mixture of oat straw and timothy is used, we would simply double the amount of oil meal.

We repeat here, as we often do, lest readers may get the impression that these formulas are to be followed with the same exactness that the druggist uses when filling a physician's prescription, that the ability of the cow to respond to the feed should always be considered by the feeder, just as the physician considers the age and condition of his patient when making up a prescription. The figures which we give are our estimate as to the average amount required by a herd of cows that are practically fresh in milk. The best cows in the herd should have more, and the poorest cows should have less, but the variation in quantity must rest with the feeder himself, who has the opportunity to watch their performance.

Mr. F. also asks whether there is a crop rich in protein that can take the place of clover for calf feeding that could be grown to advantage on ground where the crop had been cut off either for silage or fodder.

We should suppose that crimson clover would perhaps answer that purpose better than anything else that has yet been tried. Crimson clover, sown among the corn at the time of the last cultivation, makes quite a growth, and where the winters are not too severe, lives over, takes an early start in the spring, grows rapidly, and can either be turned under for fertilizing purposes, or cut and cured for hay.

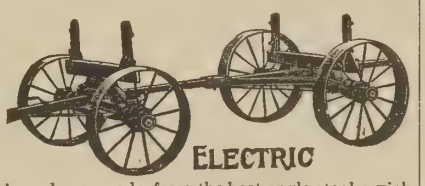
SILAGE FROM THE REFUSE OF A CANNING FACTORY.

A. C. G., Blair, Neb., has silage made from the husks, cobs and refuse corn of a canning factory, of which he is feeding from 30 to 40 lbs. per day to his cows, and is somewhat disappointed with the results, as such silage does not seem to be of equal value with the sugar beets and mangels heretofore used. The silage seems to have kept well, but he says it has somewhat of an acid taste and smell around the edges. This is not a serious objection to the silage; but like himself, we are unable to find any analyses of his kind of silage. We know that there is a very large silo of this kind at some point in Indiana that has been in use for several winters. We have had reports concerning it two or three times and all of them very favorable. Just why his should turn out otherwise we are, of course, unable to say.

It would seem as though from 30 to 40 lbs. of this silage, with 10 lbs. of either millet or oat hay, 6 lbs. of bran and 2 lbs. of oil meal ought to make a very satisfactory ration.

A RATION WITH CORN BRAN.

G. H. K., Winfield, Iowa, has all the nice oat hay that he needs. Can buy gluten meal at $19 per ton; corn meal at $12 per ton; corn bran, $10; and other mixed grains which we do not need to specify. He says the gluten meal is marked on the sacks, 24.5% protein and 4% fat.



The amounts of protein and fat as well as the price per ton indicate that the so-called gluten meal is, in fact, gluten feed. For further assurance in this line, Mr. K. can examine the material, and if he finds traces of corn bran in it he may be sure that it is gluten feed.

We are glad to have an opportunity to include corn bran in a ration, which we do as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
18 lbs. oat hay	16.40	.77	8.35	.27
5 lbs. corn bran	4.55	.37	2.99	.23
5 lbs. gluten feed	4.61	1.02	2.17	.18
Totals	25.56	2.16	13.51	.68

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

hounds are made from the best angle steel, which is neater, stronger, and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers

GENERAL SALES AGENTS.

BEWARE OF FAKE COMMISSION MEN.

We have often warned our readers to beware of all schemes and offers, which profess to give them something for nothing, or a greater return than the conditon of the markets will justify. Butter increasing nostrums, churns that are able to extract more butter from milk than its content of fat will justify, commission men that promise to give customers unusual prices, and all such misleading and deceptive appeals are based upon the maxim that, "a fool and his money are soon parted," and unfortunately they are able to find victims in all sections of the country.

Complaints have reached us that one, N. T. Redman, has been practicing this fake business from Baltimore, and in reply to a letter of inquiry, we have received the following:

BALTIMORE, Jan. 30, 1900.

DEAR SIR:—Replying to yours of the 25th relative to N. T. Redman, I beg to reply as follows:

He was indicated in the United States District Court for the District of Maryland, on December 12, 1899, for using the mails in a scheme to defraud. His letter heads and envelopes bore a cut of a very large building bearing his name in very large letters, with the words "Commission Merchant" and "Dealer in Butter, Cheese, Eggs and Poultry." He wrote very attractive letters to dealers soliciting small, trial orders, for which he paid well and promptly. He then solicited very large orders for which he neglected to pay, thus making a good cammission. This was his general scheme, but in some cases he made more than one payment. His shippers were chiefly in the northern states, reaching from states in New England to beyond the Mississippi. Redman was located in Atlanta, Georgia, about the 7th of January, brought to Baltimore, where he gave bail for $2,500, for his appearance in Court.

Very respectfully,

JOHN C. ROSE, U. S. Atty.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 8,700 pounds. Bidding opened at 24½ cents, and two sales were made at that figure. Manufacturers rejected the price for 5,400 pounds.

The quotation committee reported the market firm at twenty-four cents.

The sales reported were:

Factory.	*Pounds.*	*Price.*
Red Clover	1,260	24½c
Hinckley	2,040	24½c
Total	3,300	

The sales for the corresponding week of the three preceding years were as follows:

Feb. 6, '99, 3,480 lbs. of butter sold at 20c.
Feb. 7, '98, 3,540 lbs. of butter sold at 19c.
Feb. 8, '97, 22,740 lbs. of butter sold at 21c.

The New York Market Monday was reported steady at 26 cents. H. C. B.

Elgin, Ill., Feb. 5, 1900.

CONCERNING OUR ADVERTISERS.

While we are always reaching out for new business and new advertisers, so long as the business is honorable and the article to be advertised, of good quality, it affords us special pleasure to be favored with the continued patronage of our old customers. This is true of the Kemp & Burpee Co., of Syracuse, New York, whose advertising for 1900 starts with this issue of our paper. The advertisment which will be found on another page, sets forth in a brief way the quality and advantages of the Kemp Manure Spreader. These machines are now being largely used in the territory covered by our circulation and so far as we are able to say, they are giving the best of satisfaction. Write the manufacturers, as above, for any information you may desire on the subject.

RAPE. SPELTZ. BROMUS.

Most remarkable trio. Will make a fellow rich despite himself if he plants a plenty. Salzer's catalog tells. Send 10 cents and this notice for samples of above and big catalog. John A. Salzer Seed Co., La Crosse, Wis.

PROTECTION TO PLANTERS

is the headline of an advertisement appearing in our columns of the old established seedmen and florist, Peter Henderson & Co , 35 & 37 Cortlandt Street, New York. This announcement is to the effect that this firm no longer supply their seeds to dealers to sell again, so that to procure the famous Henderson seeds the same must be purchased from them direct.

Their advertisement also offers their annual superb catalogue entitled "Everything for the Garden," which is in reality a book of 190 pages, containing over seven hundred engravings and six superb colored plates. This catalogue is sent to all who send ten cents in stamps to cover the cost of postage and mailing. In addition to the catalogue, this firm, wishing to trace the result of their advertising in different papers, will send to all who state where they saw the advertisement, a trial collection of six packets of choice vegetable and flower seeds, contained in a red envelope, which when empty and returned with an order from catalogue will be accepted as twenty-five cents in part payment. We advise our readers to avail themselves of this unusually liberal offer.

The advertisement of the Hartman Manufacturing Company of Elwood City, Pa., which appears elsewhere in this issue, is an unusually attractive ad. It gives a very correct cut of their famous Steel Rod Picket Fence, in combination with Ornamental Steel Gate. This is an excellent lawn fence, and has the advantage of being unobtrusive, rather adding to, than detracting from the natural beauty of the enclosure. It will be found of equal value in enclosing such public grounds as school yards, court squares cemeteries, parks, etc. It is strong and durable and will twice outlast the ordinary wood picket fence and costs no more. Park and County Commissioners, School Trustees and other public officials, as well as private citizens, will find it to their interest to look into the quality and merits of this fence. Write these people for catalogue, either at Elwood City, Pa., or Room 65, 509 Broadway, New York City.

The advertisement of the Stanley Works of New Britian, Conn., makes its appearance for the regular season's business elsewhere in this issue. It will be observed, by reading the ad., that these people are manufacturers of Corrugated Steel Hinges. All those of our readers who have had occasion to use strap or T hinges in the past will remember that the ordinary hinge of these styles was short lived and generally deficient. The determination of the Stanley people to overcome these deficiences has resulted in these improved hinges. The corrugations act just like so many reinforcements and tend to make the hinges almost immeasurably stronger, while the cost is no more than the old style. Should any of our readers contemplate building or repairing old buildings, it will pay them to look into the merits of these hinges. Write the manufacturers for printed matter.

SHARPEN NG A PLOW

takes time, and some hard work. In the matter of Sulky and Gang Plows, this can be saved by purchasing such as are shipped from the factory crated, sharpened, and practically set up ready for use When plows are not crated, dropping them from a freight car and letting the shares strike on the solid platform, as is sometimes done in the hurry of unloading, is liable to break a share when drawn thin and sharp; therefore, as a precautionary measure, manufacturers who ship them uncrated, leave the shares somewhat thicker and duller. Plows not crated are also generally "knocked down", or, in other words, so thoroughly taken apart that they are not always put together correctly, resulting often in poor work or heavy draft. Putting the plows together correctly, sharpening the shares nicely, so that they are ready for work, and then crating them so they cannot get out of fix or condition, are features peculiar to the "X Rays" Sulkies and Gangs made by the David Bradley Mfg. Co., of Bradley, Ill., who are also makers of a large line of other farm tools. See their advertisement on another page of this issue.

The Anti-Clog Weeder made by Hallock & Son at York, Pa., has thousands of enthusiastic friends and there isn't any question but what it deserves them. Here is what R. R. Brinkley, of Ridgeport, Ind., has to say of it:

"I can talk from my own experience as to the value of the success of Anti-Clog Weeder in the corn field.

Last spring was a dry one here. I sowed my

BISHOP McCABE.

The Famous Minister's Experience with Coffee.

The well-known bishop said to one of his friends, some years ago, "I was a great sufferer from severe headaches, and at times after traveling many miles to dedicate a church or perform some other important duty, found myself confined to a bed when the time came, and was unable to carry out my work. I finally discovered that when I left off coffee for a few days, the headaches disappeared, and by further experiment, discovered that the coffee was undoubtedly the cause of the difficulty, which finally entirely disappeared when I left off coffee altogether."

The person to whom this remark was made is Mrs. Amy K. Glass, wife of a Methodist minister at Rolfe, Iowa. She says: "My own experience with coffee was very convincing. I was grown up before I ever drank coffee, but was advised by a friend (who meant it kindly) to use weak tea and coffee, because a warm drink aided digestion. I soon thereafter commenced to have nervous and sick headaches; could not believe it was the coffee.

"My husband, who had suffered from dyspepsia while a young man in college, and found relief by leaving off coffee, often told me he was satisfied my headaches were caused by coffee, so I gave up the cofiee and took up Postum Cereal Food Coffee. The change taught me in a most convinsing manner that coffee was the cause of the headaches, but now I have an equally good coffee in Postum, and its health-giving properties are simply undeniable. Our little children use Postum regularly and go off to school as healthy and happy as children should. If ever husband or myself take a drink of weak coffee at an evening gathering or church social, we are kept awake until past the middle of the night. Yours for health."

NEW ORLEANS, La., Feb. 5—Creamery butter, 25c; quiet. Cheese unchanged. Storage eggs, 10 to 11c.

NEWARK, N. J. Feb. 5—Market steady, 26c for strictly extra Elgins, with fair receipts. Under grades dull.

NEW YORK MARKET.

NEW YORK, Feb. 5—Butter—Receipts for the week, 30,695 packages. Exports for the week none.

The market ruled steady all through the week and there is a strong disposition on the part of receivers to advance prices on finest fresh creamery. Extra goods sold quick at 25 cents and creameries a trifle off in quality found buyers at 24@24½c; at the close there is more enquiry for finest, fresh imitations at 22@23c and best marks of fresh ladles at 18@20c.

Fine, fresh dairy tubs were quick taken at full prices and we note more trade for finest June creamery at 23@24c. We quote:

Creamery, extra, 25c; medium, 24@24½c; poor, 20@22c. Dairy, extra, 23½@24c; medium 22@23c; poor, 18@20c. Ladle, extra, 19@20c; medium, 17@18; poor, 15@16c.

Cheese—Receipts for the week, 8,450 boxes. Exports for the week, 10,373 boxes.

Exporters continue to buy few lines of full cream cheese at 11¾@12c, considerable lines of under grades at 10½@11½c, and about the entire receipts of good skimmed cheese at prices ranging from 7½@9½c Local trade is unusually dull for February and buyers quite indifferent; any fair bid on large lots of finest cheese would certainly receive good attention from most holders; the small peddling trade this week from home buyers was for fine late makes full creams at 11½@12c and fancy September and October small cheese at 12¼@12½c. Market closes with ample stock fine cheese and prices in buyers favor and light stocks of under grades which easily sold at quotations. We quote:

Full cream, small, extra, 12½c; medium, 11¾@12c; poor, 10@11c. Full cream, large, extra, 12@12¼c; medium, 11½@11¾c; poor, 10@ 1c.

Eggs—Receipts for the week, 45,448 cases.

Market for fresh stock advanced to 19c early in the week but later fell back to 17½c and closes firm at this price. Refrigerator eggs braced up a trifle on Tuesday and advanced 1@3c per dozen. Receivers are a trifle more hopeful that the balance of stock will be used at about present prices.

We quote:

New York State & Penn., finest fresh, 17½@18c. Northern & Western, finest fresh, 17@17½c. Refrigerator stock, 6@12c. Limed eggs, 10@12.

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Md, Feb. 1.—Butter—There have been moderate receipts in all grades of butter during the past week, and a fair demand has kept the market steady, although a feeling of unsettlement has prevailed in all departments. The unchanged conditions which have been maintained at primary points during the past two weeks, will naturally produce a feeling of confidence to be followed, it is hoped, by more active business. Fine creamery has been coming forward in about the usual quantity, and has moved on into the customary channels of consumption; we can make no change in our figures on this grade, most of the trading being at 26 cents. Receipts of fresh gathered cream stock continue extremely light, and do not wait long for buyers, the favorite marks commanding a fractional premium on our quotations. Fine ladles and imitation creamery have also been coming forward sparingly, and are in rather more eager request; clean flavored butter of this grade is quickly salable at figures quoted. Roll butter is in light supply and is selling promptly. Choice Ohio rolls of good color find a market at 18 cents; much of the stock coming in is light in color. Store-packed goods are also scarce and in good demand.

Creamery separator, extras, 26c; firsts, 24@25c; seconds, 22 23c; gathered cream, extras, 24@25c; firsts, 23@24c; seconds, 21@22c; Ohio, extras, 24@25c; firsts, 23@24c; seconds, 21@22c; imitation, extras, 22c; firsts, 21c; seconds, 19@20c; Iowa and N. W. ladle, extras, 20c; firsts, 18@19c; seconds, 17c. Ohio & Indiana ladle, extras, 19@20c; firsts, 18c; seconds, 16@17c; Ohio rolls, extras, 18@19c; firsts, 17@18c; seconds, 15@16c; W. Va. rolls, extras, 17c; firsts, 16c; seconds, 15c; Ohio and W. Cheese—Receipts are ample for the demand; market firm at unchanged prices. N. Y. State—Cheddars, fine, 12¾@13c; choice, 12¼@12½c; fair, 11½@11¾c; Flats, fine, 13c; choice, 12½@12¾c; fair, 12@12½c; Small, fine, 13¾@13½c; choice, 13c; fair, 12½c; Ohio—Flats, fine, 12½@12¾c; choice, 12¼@12½c; fair, 11½@12c; Picnic, fine, 13@13¼c; choice, 12½@12¾c; fair, 11½@12¼c; Swiss cheese, fine 12@12½c; choice, 11½@11¾c; fair, 10½@11c. G. M. LAMB & BRO.

301 Exchange Place.

Eggs—While the receipts of fresh egg have not been excessive, they have been about equal to the demand, which continues quite good; our market, in sympathy with others, is not active, but take it altogether, we do not hesitate to write it in fairly good shape at 17c.

LIVERPOOL, Feb. 5—Butter—Finest United States and good, nominal. Cheese—American finest white, 56s 6d; American finest colored, 59s.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Butter and Cheese Maker, age 34, single, German, acquainted with the latest inventions and owning some apparatus and good machinist tools, would like to take charge of a creamery. (Eastern state.) Address No. 50, care this paper. 52-4

Position Wanted—As farm manager, by practical, up-to-date American, single, 30, no habits, thoroughly experienced, and competent in agriculture, horticulture, stock raising, dairying, etc, in all details. Understand modern farm and dairy machinery. Highest references. Address THAYER FARM, Durham, Conn.

For Sale—Holstein-Friesian calves of the best breeding. Have only 4 bulls and 2 heifers left, which we now offer at the bargain price of $25.00 each, registered, transferred, crated, and delivered to Express Co. We are also offering 7 fine young grade and a few registered cows at selling prices, the most of them fresh, or soon will be. F. G. JOHNSTON & CO., Station B, Columbus, Ohio.

For Sale—A registered Guernsey bull. RAY BICKNELL, Fort Atkinson, Wis.

Wanted—Man with family for dairy farm; one or two boys to milk preferred, March 1st. ROBT. PERSONS, Onawa, Ia.

Wanted—A registered Guernsey bull. Address Box 388, Kenosha, Wis.

Wanted—A situation as cheese maker. Eight years' experience. Address BOX 16, Milton, Wis. 52-2

For Sale—A good dairy, well located, one mile from LaFayette. Fifty cows. Two retail wagons. Good reason for selling. Address for particulars, J. H. KORTY, LaFayette, Ind. 52-2

For Sale—The best milk business in a town of thirty thousand. Dairy of 50 Jersey cows, with everything complete; selling over 400 quarts daily. A fine business. Good reasons for selling. F. M. PARSONS, Burlington, Iowa. 52-2

Wanted—An experienced dairyman to work farm. A. F GOULD, Lima Centre, Rock Co., Wis. 52-2

Jersey Bulls For Sale—Ready for service; eligible to registry. Address, T. C. RUMPF, Fort Atkinson, Wis. 51-tf

?

There is one all-important question confronting every creamery concern and every creamery operator for 1900. The sooner answered the better. A looking-backward answer at the end of the year may afford very little satisfaction.

Nine-tenths of the creameries in the country using "Alpha" disc separators—regardless of all other considerations—are prospering and progressing. No well-informed man can question that statement.

Nine-tenths of the creameries in the country using "hollow-bowl" separators—regardless of all other considerations—are being operated without profit or at a loss either to their owners or patrons; they are standing still or more likely going backwards. No well-informed man will question this statement.

There are nine chances out of ten that one or the other of these descriptions fits the circumstances of **your own** particular case.

What are YOU going to do in 1900? Are YOU going to prosper and progress? Or are YOU going to stand still, or go backward?

If you think it may possibly help you to answer this question to your own satisfaction, let us send one of our traveling representatives to see you, or let us give you any separator information you may desire. It is our business to serve you in such manner.

THE DE LAVAL SEPARATOR CO.,

GENERAL OFFICES:

CHICAGO. 74 Cortlandt Street, MONTREAL.

SAN FRANCISCO. NEW YORK. PHILADELPHIA.

Ayrshire Calves For Sale from the Choconut Valley Herd. P. BYRNE, St Joseph, Pa. 51-2

For Sale—Shetland stallion, Pilot No. 884, dark bay, heavy mane and tail, 45 inches high. Foaled May 20th, 1888. Drives single and double; very gentle. The first check for $100 will catch him. JAS. DRIVER, Darlington, Wis. 51-4

For a desirable creamery location inquire of H. H. SMITH, New Richmond, Wis. 51-3

Wanted—A skilled butter maker, either married or single, as working foreman on a 100 acre A. J. C. C. dairy farm within twenty-five miles of Philadelphia. Must be a total abstainer and have good reference. Address W. M. B., Room 1310, Land Title Building, Philadelphia, Pa. 51-2

For Sale—Very cheap, in perfect order, combined churn and worker, cream vats, tester, etc., etc., for dairy or small creamery. L. D. PASSANO, Jr., Box 251, Warrenton, Va. 51-2

I want for year or longer, first-class working foreman on stock farm near Chicago. Give age, experience, family, where been employed, wages received, etc. C. H. BUNKER, 136 Monroe St., Chicago. 51-2

Wanted—Location for creamery. For further particulars address, No. 302 Commercial St., Neenah, Wis. 51-2

Wanted—A first-class tenant for a first-class dairy and general purpose farm of 120 acres. Apply immediately. C. E. WARNER, Windsor, Dane Co., Wis. 51-2

Creamery Plant For Sale—Line of three creameries in Dane Co., Wisconsin, all in first-class shape, latest improvements, etc., doing a good business. Satisfactory reason for selling. To the right party will sell on favorable terms. For particulars apply to M. L. BROWN & CO., 141 So. Water St., Chicago, Ills. 50-tf

The undersigned wishes to arrange for a regular shipment of four cans of high grade milk with some dairyman near Milwaukee. Address, P. J GROGAN, 2611 Sycamore St., Milwaukee, Wis. 50-3

For Sale—Twenty-five high grade Jersey cows, thirty-five one and two-year-old heifers, by St. Helier's Cowboy 44822. For particulars address, HUMPHREY BROS, Fairmont, Kansas. 50-4

For Sale—De Kol Bulls. Officially tested dams. Send for catalogue. M. S. CAMPBELL, Genoa, Ill. 49-10

For Sale—Pure bred Tamworth pigs ready to wean. Also a few Holstein bull calves. GLIEDT & KAISER. Freistatt, Mo. 48-9

Wanted Now—A strong, able and sober married or single man to work by the year on farm in Illinois. Must be good milker. For further particulars address A. J. DAUGHERITY, Streator, Ill. 46-tf

For Sale—Dairy and outfit. Terms easy. R. A. LAMBERT & SON, Mobile, Ala. 46-tf

Buttermaker of 9 years' experience wants a steady position. Married. Will furnish good references. Work guaranteed. State wages. Address J. R., care HOARD'S DAIRYMAN. 46-tf

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman 44-tf

Wanted—Position by an experienced butter maker. Best of references from last employer. Address J. R. WEIR, Le Roy, N. Y. 51-4

For Sale—A cheese factory in good dairy district. Received for season of 1899, 859,465 lbs. milk. Also a general store run in connection, goods invoicing about $800.00. Satisfactory reason for selling. Full particulars by addressing P. M. at Lawrenceville, Wis. 51-2

Correspondence solicted with parties having capital to invest in private creamery. 230 cows pledged within radius of four miles; more to come as soon as creamery starts. Splendid dairy country. Five miles to R. R. station. Address, J. M. MOE, Chetek, Wis. 50-3

Excursion Rates to Mid-Winter Mardi Gras and Carnival, Milwaukee, Via the North-Western Line. Excursion tickets will be sold at reduced rates February 9 and 10; limited for return until February 12, inclusive. Apply to agents Chicago & North-Western R'y.

Excursion Rates to the Mardi Gras and Winter Resorts—Via the North-Western Line. On account of the Mardi Gras at New Orleans and Mobile, excursion tickets will be sold February 19 to 25, inclusive, at very low rates, limited for return passage until March 15. Excursion tickets are also on sale daily, at reduced rates, to the principal winter resorts in the United States and Mexico. For full information apply to ticket agents Chicago & North-Western R'y. 52-2

Half Rates to National Creamery Butter Makers' Convention, Lincoln, Neb.—Via the North-Westeru Line. Excursion tickets will be sold at one fair for the round trip, from all stations, February 17 and 18, limited for return until February 28, inclusive. Apply to agents Chicago & North-Western R'y, 52-2

Grand Excursion to Old Mexico—Via Chicago & North-Western Railway, to leave Chicago Tuesday, January 30, 1900, under personal direction of Mr. J. Grafton, an experienced excursion manager. Entire trip in special train with dining car. Tour is arranged to include Mardi Gras at New Orleans and all principal points of interest in old Mexico and ticket covers all expenses. Only limited number can be accommodated; secure space early. For descriptive pamphlets and information, call on, or write agents Chicago & North-Western R'y. 47-4

Tour of Puerto Rico.—The American Tourist Association announces two tours of the beautiful island of Puerto Rico under escort of Mr. Walter Boyd Townsend, the well-known artist and traveler, through and around the Island by rail, carriage, automobile and boat. Special Pullman Cars leave Chicago Thursday, February 15, and Thursday, March 8, at 12, noon, connecting with the splendid new steamships Ponce and San Juan sailing from New York second day following. Tickets include all expenses everywhere. All railway, steamer and sleeping-car fares, meals and berths on steamers, meals on dining car, hotel bills in New York and Puerto Rico, all transfers, carriage rides in the cities and through the Island, guides and interpreters are included in the tickets. There are no extras. Tours are under the direction of Reau Campbell, General Manager, A. T. A., 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to the Agents of the Chicago, Milwaukee & St. Paul R'y. 48-sp

Kansas State Dairymen's Association.

The thirteenth annual convention of the Kansas State Dairymen's Association held in the rooms of the Kansas State Agricultural College, was, in many ways, ahead of other meetings of this character. A program was prepared for the meeting, that touched the vital defects as also the advantages of Kansas dairying at the present date. The meeting was called to order at 3:30 p. m. on Wednesday afternoon, Nov. 22, by President F. S. Hurd.

On behalf of the city Mr. Sam Kimble welcomed the Association, and among other things uttered some of his own experience when a boy. He was a sort of a dreamy boy and loved to whistle or sing when milking. It was in the good ancient time when the calf would be allowed to suck on one side while the milker occupied the other, and thus a lusty race continuously in progress between the calf and the boy, who should get the biggest share. When the boy was whistling Captain Jenks or Yankee Doodle, or tunes of like measure, no complaint was heard, but when he changed to Auld Lang Syne or Home Sweet Home, a "Sam, hurry up there, you are letting that calf get all the milk," would ring out from the head of the farm department. The cow undoubtedly liked "Home Sweet Home" the best.

Seriously considered, this brings out the point of quick milking and a matter never before discussed, the proper melody or stanza to adopt at milking time.

Acting President Nichols extended welcome on behalf of the college and explaining the college work he laid particular stress on the change that is coming. More time is now given to the harmonious training physically and mentally of the students; they do not acquire a classical knowledge to the extend they used to. The motto of the institution is to teach good practical knowledge that will fit the students in after life to live better and enjoy life more. Good common sense is impressed on the minds of the boys and girls in attendance. Mr. Nichols also explained the work of the Experiment Station. However, the result of this work is well known to most of our readers, it being very creditable. Mr. J. F. Nissley, of Topeka, in well placed words responded, laying particular stress that close co-operation should exist between the farmers and dairymen of the state and the college that to-day is doing much to better the farmers' condition.

President Hurd, in his address, recommended that serious consideration and active aid be given the National Dairy Union in its fight to secure the 10 cent tax on colored oleomargarine. He recommended that this question be properly represented to the National Live Stock Association, which meets at Fort Worth, Texas, Jan. 16, 1900, and if possible, their assistance secured. He said:

It is a fact that none will dispute, that if every pound of oleo were sold as such and not palmed off on unsuspecting customers as genuine butter, the dairy industry would be greatly stimulated. If this were done, thousands of men who are now handling beef cattle on a small scale, and thousands of "general-purpose" farmers would be attracted to the dairy business, leaving a gap in the beef-producing field and resulting in a stimulus to that industry as well.

Mr. C. A. Barnes in his paper "Fuel and Oil Consumption in Creameries," pointed out that operators should study their individual separators and engines, and use the best coal and oil, it being the most economical in the long run.

"How Near Elgin Can Kansas Creameries Pay for Butter Fat?" was the subject of A. Jensen, of Manhattan.

Mr. Jensen said in part: The subject, "How Much Below Elgin Can Kansas Creameries Pay for Butter Fat?" is rather a broad question, and it took me nearly three months of study to find a just explanation to creamery owners and patrons alike

All Kansas creameries can not pay the same price for butter fat, for several reasons. Some get a large supply of milk, and can produce a better class of butter than others, the cause of which might only be local, but just allowances must be made for conditions as they are.

In the following table the first column gives various outputs of butter; the second column gives several prices for butter at Elgin; the third column gives the corresponding prices in Kansas; the fourth column gives the total cash received for the several outputs at the several prices; the fifth column gives the total expense of producing the butter; the sixth column gives the net balance to pay for butter fat; the seventh column gives the total butter fat in the output after 14 per cent overrun has been deducted; and the last column gives the net prices that can be paid for butter fat by Kansas creameries at the given outputs and with the given Elgin prices for butter:

TABLE SHOWING NET PRICES THAT CAN BE PAID IN KANSAS FOR BUTTER FAT UNDER VARYING CONDITIONS.

Output of butter for one month.	Elgin butter price.	Price obtained for butter.	Total cash received.	Total expense.	Net balance to pay for butter fat.	Total butter fat after 14 per ct. overrun is deducted.	Net price paid for butter fat.

It is interesting to note that while so many other lines of business are forming trusts, combinations, pools and monopolies, neither the creameries nor dairymen are attempting any such questionable methods of advancing their business interests. The prices in dairy markets are regulated alone by the laws of supply and demand, and neither the supply nor demand can be controlled by the dairymen in any direct manner. All the dairy people ask is that their honest goods may be sold for just what they are, and not have to compete with cheap imitations and substitutes.

Mr. Hurd also recommended a dairy commissioner for Kansas for the great benefit of all concerned.

In 1894-7 the creamery industry of Kansas was at its best. For three years the Kansas farmers only raised small crops, and in Mitchell County, where I was located then, or in fact the whole western part of the state, raised no crops at all. It was considered then by nearly all the farmers that the creameries were the standby, and it was no unusual occurence to receive from 20,000 to 50,000 pounds of milk per day at each creamery and station. What conditions exist to-day? The receipts all over the state will hardly average 2,000 pounds of milk daily for each creamery, when it should be at least five times as large. The farmer's milch cow of then is now only a stock cow—an animal that only can produce a calf every year, and if the calf should die, would be a net loss to its owner of at least $15; and the worse feature about the cow is, she has lost her milking qualities.

Great interest was taken in the patrons' class; they will be made a permanent feature of the meetings. For next year a fund of $50.00 has been raised to be given the patron standing highest. Ludolp Gabe brought out the practical points of milk and cream testing.

It was brought out that the glassware for testing is not always correct, and to get a correct composite sample at all times and under all conditions, a milk thief or the Scoville milk dipper should be used. H. VanLeeurven brought out the crying need of a dairy commission, authorized to inspect creameries, and the glassware in use for testing.

J. G. Haney, of the Kansas Experiment Station, related that in their trials of feeding creamery skim milk to hogs they had found it superior to any other ration; the gain on skim milk and kafir corn fed hogs was 2.43 pounds per day each, and brought 40 cents per 100 pounds for the skim milk. The hogs sold for $3.50 and the kafir corn was valued at 30 cents per bushel. In other trials with different feeds, from 20 to 24 cents was netted per 100 pounds for the skim milk.

Jacob Lund's paper on "Care of Boiler and Engine," brought out the truth of the old maxim, "one stish in time saves nine," and that cleanliness generally assured a competent engineer. Mr. F. F. Fairchild and James Robinson stated their experience with milk cows. Mr. Fairchild is in the eastern part, Mr. Robinson the short grass country. Mr. Fairchild's average income per cow in a year is $71 and Mr. Robinson receives $60 cow per for butter fat and calf. Mr. Robinson concluded by saying: "Let me say to the farmers of the short grass country, stay by your cows and your creamery—two of the best things we ever had. Be as liberal as possible to both, liberal in your care of your cows, making you a liberal patron to your creamery." Hon. F. D. Coburn gave a very interesting talk on "A Visit to an Eastern Milk Farm." He concluded as follows:

It is well worth thinking about that this Yankee, with a herd of 150 cows, in such a rigorous climate, can so breed, and feed, and milk them that one with another, the poor, the medium, and the good, the fresh and the farrow, the heifers and the old, shall average for every day in the year 7½ quarts of 5 per cent milk, and that his manipulations of them, and his good name, enable its selling, winter and summer, for 8 cents a quart, or from 25 to 35 per cent more than is paid to his neighbors who are in the same business. There is not one of us but could well afford to sit at the feet of and learn wisdom from a man wherever and whoever he might be, who had so managed even one cow as to obtain from her $100 worth of milk product in a year, but here is a man, not trained to the business, yet strictly a business man, who mixes his bran with brains, maintaining an extensive herd, larger than any I know of in Kansas, who so manages it that the yearly gross income from each cow is nearly $219.

We do not have his 8-cent market for our milk, but in well-nigh every other respect we have advantages innumerable to which this man without accessible pasture, who feeds $4-ensilage and $20-bran must by the very nature of the circumstances be a stranger. We have the grains and the grasses for the making of milk the equal of any, at a cost so small compared with the prices he must pay for like commodities as to make a comparison seem well-nigh ridiculous; besides a mild climate and short winter seasons which

Truest Economy to Get the Best.

A cheaply made sewing-machine is dear at any price, because faulty in action, liable to break and difficult to operate. A labor-saving machine for woman's use should be the best; it is truest economy to get a sewing-machine bearing this trade-mark.

give us a tremendous advantage. So long as we in large part ignore these, the wealth of opportunities all about us, we shall but advertise ourselves as content to be in a measure laggards, commonplace and ordinary. When we learn to utilize them to anything like the limit of their possibilities we shall be rich, prospered and prosperous.

Professor D. H. Otis, on the subject "Feeding and Developing the Kansas Dairy Cow," brought out the absolute necessity of testing each individual cow. The scale and the Babcock test should be in every barn. He proved among other things that the receipt from the 11 poorest cows in the college herd less cost of feed, amounted to $41.63; only $1.26 more than the receipts from the best cow less the cost of feed. He concluded his lecture with the following practical advice:

But Kansas can never expect to reach the goal in dairying until she applies more business principles to the handling of cow machines. This shifting from milk to beef and back again from beef to milk is a practice that is eating the very bottom out of our profits. After a man spends several years in grading up a dairy herd, it is folly for him to change to raising beef animals from the same herd just because beef is higher than butter fat. Such changes cannot be made in a day and by the time he has accomplished his end the tables will be changed and butter fat will be higher and beef lower, and he will then wish he had the experience. the growth, the development he would have had by sticking to one thing and making the most of it.

As will be seen from the above figures, the question is not so much how we can get more cows, but how we can get cows of a better brand. We want and ought to have cows that yield so much that the farmer cannot afford not to milk them no matter what the price of beef. To do this, records and the methods of men who are making a success of the dairy business need to be brought before the public. This in connection with experiments and instruction at the college, in connection with constant agitation along the lines of feeding and breeding, will undoubtedly bear fruit sooner or later in raising the standard of the dairy industry throughout the state.

The "Skim Milk Calf" was discussed by J. A. Conover, of the Kansas Experiment Station. He made his calves gain an average of 1.77 pounds per day, on creamery skim milk and kafir corn meal, and summarizes his experience as follows:

1. Let the calf run with the cow for the first three days; gives the calf a better start, and is better for the cow.
2. Dehorn all calves while young, preferably when they are two days old; saves time, money and pain.
3. Let the calf get hungry before you try to teach it to drink; you will feel better and so will the calf.
4. Be kind with the calf and deal with it gently.
5. Change gradually from whole milk to skim milk; do not overfeed.
6. Feed all milk warm and sweet; if a young calf, feed often, three times a day.
7. Feed grain dry; do not mix it with milk.
8. If troubled with scours, cut down on feed, give castor oil or raw eggs. Keep all pens, pails, etc., sweet and clean.
9. Keep the dairy calf thrifty and the beef calf fat.
10. Do not let the calves suck each other's ears and noses. Tie them up.
11. Keep plenty of nice fresh water where they can get at it all the time.

"The Relation of Patrons and Creamerymen was discussed by G. W. Priest and C. F. Armstrong. This touched a very interesting subject, and it was conceded that closer co-operation between patron and creamerymen was needed. The light receipts at the creameries entail proportional heavy running expenses. Facts proved, better receipts mean better prices for butter fat, and that Kansas creameries can pay close to Elgin prices for butter fat if 20,000 pounds of milk was received at each factory.

Methods were suggested to bring this about, such as a fixed price for butter fat, based on a standard market; education among patrons. The creamerymen are willing to adopt any reform demanded by Kansas patrons, if conditions will be improved thereby. However, the large price of calves, high-priced beef, good crops and high price of same were considered the main cause of the lack of interest taken in dairying at the present time among Kansas farmers.

J. H. Taylor brought out the fact, that the cheese making industry is coming to the front; that conditions are favorable, and as good cheese can be made in Kansas as anywhere.

The following officers were elected for the ensuing year: President, W. F. Jensen, Beloit; Secretary and Treasurer, A. L. Goble, Riley; Assistant Secretary and Treasurer, T. A Borman, Enterprise.

Three Hundred and Thirty-three and Three-Tenths Pounds of Butter per Cow, and not Satisfied.

ED. HOARD'S DAIRYMAN:—As we are through with 1899, I have figured up what our herd has done. We milked 23 cows, counting in the two and three-year-olds, and the average was 333⅓ pounds of butter each by Babcock test. Our best cow made 458 lbs. of butter, and was dry 2 months in the year. I want to bring the average up to 400 lbs. of butter each, and I think I can by the aid of your most valuable paper.

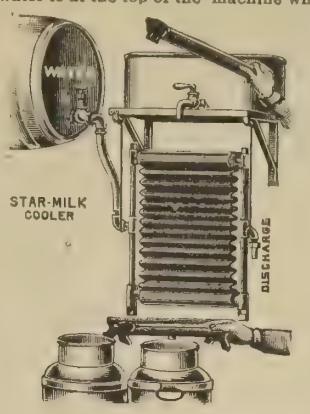
Will you please make me out a ration of the following: Clover hay, wheat bran, corn and oats, half and half, oil meal and gluten meal. I use the oil meal in the winter time as I have no roots or silage, and in the spring I change to cotton seed.

Oakdale. F. M. S.

We regret that F. M. S. omitted to give the name of the state in which this particular Oakdale is located, but more than this we regret that he did not give more particulars in regard to his herd and the care given his cows.

Our suggestion for a ration formula is as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
4 lbs. corn and oats..	3.56	.34	2.08	.17
3 lbs. bran	2.64	.38	1.16	.09
2 lbs. oil meal.....	1.82	.59	.65	.14
Totals.....	24.96	2 67	11.05	.74



For cows not in full flow of milk this would be too much, and we would cut it down most in the most expensive feeds.

AERATION

Why do STAR Milk Aerators and Coolers AERATE Milk as well as COOL IT?

Because, as the milk becomes cold so does the water used for cooling become warm; this warm water is at the top of the machine where the warm milk strikes it first, the milk spread out in a thin film exposed to the air, flows downward as the water flows upward, the milk gradually coming in contact with colder water until it drops off the cooling surface where the fresh water is slowly entering, into a collecting trough. The milk is thus subjected to a gradual and continuous reduction of temperature while exposed to the air, the evaporation necessarily taking place under this condition forces out the animal heat and with it the objectionable odors.

This result cannot be accomplished by chilling the milk as would be the case if brought in contact with an ice cold surface.

For thorough aeration a gradual and continuous reduction of temperature is absolutely required; this result can only be produced by a machine that has a long flow for the milk and also for the water; it is essential that the water should become warmed so that the milk is gradually cooled during the process of aeration. In the smallest size STAR AERATORS AND COOLERS the film of milk has a downward flow of at least forty (40) inches.

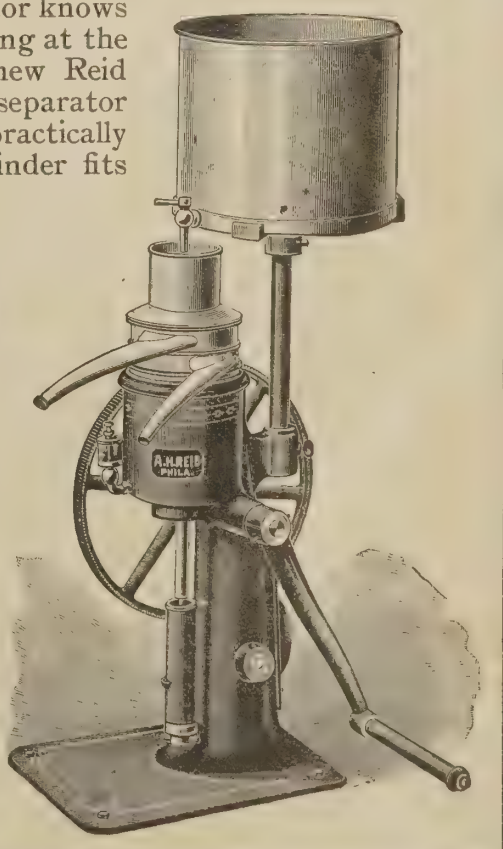
No Rubber Rings

Hand separator construction has reached perfection in the improvements possessed by the Reid 1900 Hand Separator—the machine without a rubber ring. Everyone who has used an old style hand separator knows the trouble and annoyance caused by the rubber ring at the top of cylinder. This is done away with in the new Reid machine, which is the most simply constructed separator as it is the most effective skimmer. There is practically only one part inside of bowl. The top of cylinder fits securely, without threads or screws.

You have the privilege of trying the

REID 1900
Hand Separator



for ten days without any charge whatever. Give it a thorough trial and be convinced, as was the dairyman who wrote the following letter:

"In order to satisfy myself before purchasing a separator, I tested the following machines: DeLaval, Sharples, National, Mikado and Reid. The samples, which I took personally, were tested by a party who did not know to which machine they belonged. It was found that the Reid was very much the closest skimmer, and at the same time, I thought lighter running than any of the others."

Marlboro, N. J., Jan. 1900. THOS. WILLS.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy Meetings—Milk Testing at Factories—Cheese Curing Rooms—Points For the Patron—Sanitation at Cheese Factories—Lime in Cheesemaking—Fermentation Test for Milk.

ED. HOARD'S DAIRYMAN:—In our last letter we gave a short report of what took place at the annual gathering of Eastern Ontario dairymen held at Madoc. During the week following the Eastern meeting the Western dairymen held their annual gathering at Stratford. This was the thirty-third annual convention of what is now known as the Cheese and Buttermakers' Association of Western Ontario.

Thirty-three years is a long period to look back over. Where there was one cheese factory in Canada in 1867 there are twenty-five to-day. At that time co-operative creameries were unknown in this country and to-day we number them by the hundreds. Such is the progress that perseverence, honest methods and enterprise have wrought in all these years.

A glance over these years of progress in dairying is not unaccompanied by a tincture of sadness. Many names familiar to dairymen at their annual gatherings twenty-five years ago, no longer appear on the program. They have departed to another sphere but their work lives on. There is, however, one of the old vanguard with us still, whose name forms a connecting link between the present, and those early days when dairymen had to struggle against great odds in bringing their business to the front. The gentleman to whom we refer is the Hon. Thomas Ballantyne. Though aged somewhat in appearance he addressed the Stratford meeting with much of his old time vigor and force, urging dairymen to better methods and better care in dealing with the cow and her products.

The convention opened under most favorable auspices with President Harold Eagle in the chair. In his opening address he emphasized the necessity of changing the name of the association to the old one of the Dairymen's Association of Western Ontario, more familiar, perhaps, to the readers of the DAIRYMAN than the one now in use. The present name conflicts with that of the Makers' Association which meets at Ingersoll next week.

The directors report pointed out that in many sections of Western Ontario the past season had not been as profitable as others for manufacturers and makers because of the great shrinkage in the milk. On the other hand the extra high prices which prevailed served to offset this drawback so far as the patrons are concerned. During 1899 four travelling instructors were employed by the Association in visiting the cheese factories and creameries in its district; $200 was given in prizes for essays by makers who had been employed in cheese factories and creameries during 1899. This resulted in over seventy essays being received on cheese and buttermaking.

While the instructors reports were more or less of a routine nature one or two important facts were brought out. A great many of our factories are still without a Babcock test. That any factory in this age should be without this valuable instrument is passing strange. Surely the owners or managers have not attended dairy conventions or read our agricultural journals, including this valuable dairy paper, or they would be more in advance of the times.

Another fact brought out was that very few of our cheese factories are paying for milk according to its quality. While no reason is given for this state of affairs, there must be one somewhere. There is a growing suspicion among not a few dairymen that either the machine or the person who does the testing is not to be depended upon. Where Babcock machines are manufactured in such large quantities as is the case at present there seems to be good ground for believing that some of the test bottles might not be as accurate as they might otherwise be.

One gratifying feature of the reports was the improvements noticeable in many of the curing-rooms, and the methods adopted for controlling the temperature. Several factories have had sub-earth ducts put in with splendid results. The instructors reported many factories as still behind in their methods of curing, and also many where the making rooms were anything but perfect places for making cheese in. Still the agitation of recent years for better and more up-to-date factory buildings, is having its effect, and a gradual improvement is noticeable each year.

Mr. A. F. MacLaren, M. P., known to many Americans as the maker of MacLaren's "Imperial" cheese, which scored perfection at the World's Fair, in advising dairymen to keep on improving the product, gave a few pointers that are well worth noting. The patron must be more careful about his farm and buildings, keeping everything a little cleaner and tidier than before; the man who draws the milk must give more attention to his duties, and keep his wagon, can and himself cleaner, and everyone connected with the trade must do better than ever before, if this improvement in quality is to be brought about.

An important topic introduced by Dr Bryce, of the Provincial Board of Health, was that of sanitation at cheese factories and creameries. He advised the appointment of an inspector in every county, whose duties would be to look after and see that proper sanitary conditions were maintained at the factories; such inspectors to be skilled bacteriologists. A movement of this kind seems to be along the right line. Not only would it tend to improve the conditions pertaining to health in localities where factories are situated, but it would be an incentive in the way of improved factory buildings, as owners would not like to incur the enmity of the inspector by continuing to make cheese or butter in old, unsanitary and half-decayed structures.

Prof. Dean gave the results of some very interesting experiments carried on at the Provincial dairy school, last season, on the use of a lime solution in cheese making. These were not altogether conclusive, and

Now is the time to take up the Question of

GEO. A. BUCKSTAFF, Oshkosh, Wis.

FOR SALE—For a short time we are offering A. J. C. C. **Jersey Bulls** from two to fourteen months old at **reduced prices.** They are from choice cows and are sired by St. Lambert of Brodhead 46957, one of the best of bulls, as his pedigree will show. We also have a few cows and heifers for sale. Write for catalogue.
N. N. PALMER & SON, Brodhead, Wis.

will be repeated another year. The results are summarized as follows:

1. An ordinary lime-water solution, when mixed with rennet for ten or twelve hours before the rennet is added to the milk, destroys the action of rennet, but such an effect does not result if the rennet and lime-water be mixed shortly before renneting the milk.

2. Calcium chloride solutions, so far as have been observed, do not affect rennet action adversely.

3. The yield of cheese was slightly greater in several instances where the lime solutions were used, but this difference in yield may or may not have been due to the use of the lime compounds in the milk.

4. There was little difference in the quality of the cheese, so far as has been observed yet, though many of them are too green at this time to judge of their quality.

5. In the case of pasteurized milk, the lime solutions did not restore the texture and body of the cheese, though there appears to be a slight improvment in the quality as the result of adding chloride of lime solution to pasteurized milk for cheese-making.

6. Our results are tentative at present, and require further work to settle the question of the effects of lime solution in cheese-making.

In the discussion on cheese-making, which followed the reading of the first and second prize essays on that subject—the best makers agreed that a fast working vat of milk should be set at a lower temperature than that for normal milk, and heated gradually to 98° or 99°. After the particles of curd were firm, and immediately before the whey was run off, it might be an advantage to heat the vat two or three degrees higher; 78° to 80° was the best temperature at which to put a curd to press.

Prof. E. H. Farrington, of Wisconsin, who made his first appearance before a Canadian dairy audience at Stratford, acquitted himself well. While his addresses were well received, his strong point was in bringing out a good discussion. This he effected in an admirable way, when called upon to open the discussion on buttermaking, after the reading of one of the prize essays on that topic. Flattery is not one of our failings, and therefore we speak the truth when we say that Prof. Farrington was instrumental in bringing out one of the very best practical discussions we ever listened to. Many butter makers were sorry that it had not been brought on at an earlier stage of the convention. The discussion was unfortunately cut rather short on the last day, in order to bring the convention proceedings to a close.

Prof. Farrington recommended the use of the acid or fermentation test in detecting tainted milk, rather than depend altogether upon the sense of smell, when the milk is delivered. Milk for separating should not be heated by forcing steam into the milk. It should be heated by passing the milk over a heated surface. He recommended the use of the composite method in taking samples from the skim milk outlet when separating. The influences effecting the rate of cream ripening are the thickness of the cream, time held, number of bacteria and temperature of the cream. The churning temperature is the temperature of buttermilk when the butter breaks. He recommended using the Babcock test instead of the oil test churn in cream gathering creameries, as it was more reliable. The gatherer could weigh the cream and take samples for the Babcock when on his rounds.

The causes of water in butter received some attention. Prof. Farrington outlined some experiments he had carried on at Madison in order to find out the amount of water in salted and unsalted butter. In every case there were more drops of moisture on the salted than on the unsalted butter, but a chemical analysis showed that the latter contained about 4% more water than the former.

Prof. Farrington's experience had shown that butter with large granules contained more moisture than butter with small granules. This was contrary to the experiences of Prof. Dean, whose experiments at Guelph had shown the very opposite. Evidently these two dairy teachers will have to try this experiment over again.

The temperature for pasteurizing was given some attention. Prof. Farrington gave an account of some experiments which showed that heating to a temperature of 140° did not effect the normal condition of the milk while it was sufficient to kill tuberculosis germs, if kept at this temperature for 15 minutes.

Professor Farrington also addressed the convention on "The Known and Unknown about Butter Making," and "Testing Cows on the Farm." In connection with the latter address which was given in the evening, he gave some stereopticon views showing the types of cows kept on four farms in the vicinity of Madison, Wis., which were tested by him to show which was the most profitable cow. From the types presented we would gather that in selecting cows the dairyman should not go altogether by form, but must know the quality and the quantity of milk which each cow gives.

A very valuable address on "Soiling Cows in Summer" was given by one of our practical dairy farmers, W. C. Shearer, Bright, Ont. He advised sowing as early in the spring as possible a half acre with a mixture of one bushel of peas to a bagful of oats at the rate of two and three-quarter to three bushels per acre. In ten or twelve days sow another half acre in the same way, then another ten days later until about three and a half acres are sown. The first will be ready for the cows about the first of June, and the others will keep the supply of green feed till the 1st of August when early corn will be ready.

Other speakers, who addressed the convention, were Andrew Pattullo, M. P. P., a former president of the Association; A. W. Campbell, Provincial Road Instructor; D. Derbyshire, President of the Eastern Dairyman's Association; J. N. Paget, Dr. W. T. Connell, of Queen's University, Kingston, and Dr. James Fletcher, of the Central Experimental Farm, Ottawa. Their addresses, though not bearing as directly as the others on the practical work of cheese and butter making, were full of interest and of value to every dairyman who was privileged to hear them.

The officers of the Association for 1900 are: Hon. president, Hon. Thos. Ballantyne, Stratford; honorary vice-president, John Prain, Harriston; president, R. M. Ballantyne, Stratford; 1st vice-president, Aaron Wenger, Ayton; 2nd vice-president, James Connolly, Porter Hill; 3rd vice-president, J. N. Paget, Canboro.

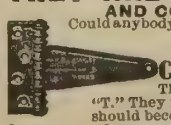
Directors—M. Morrison, Harriston; Geo. H. Barr, Sebringville; Geo. E. Goodhand, Milverton; A. F. MacLaren, M. P., Stratford; John Brodie, Mapleton; Robert Johnston, Bright, and Harold Eagle, Attercliffe Station. J. W. WHEATON.

Toronto, Ont.

The Profit in Feeding Balanced Rations.

ED. HOARD'S DAIRYMAN:—We certainly should not like to be without the DAIRYMAN. It has taught us many valuable lessons, too numerous to mention, but will specify one instance, however. It has taught us that a balanced ration for our little herd of Jerseys is the cheapest ration (all things considered) that we can get. We have nearly doubled the amount of butter since adopting it.

When we commenced taking the DAIRYMAN we didn't know a balanced ration from a bushel of sawdust. Am satisfied the average feeder is not using one-half enough protein, but like grandfather, many feed only corn fodder and corn in the ear. I am therefore very grateful for your most excellent paper; it has been worth to me many, many times its cost. E. T.



Richfield Centre, Ohio.

Why is it, that with all the accumulating testimony in favor of a balanced ration, of which the above is but a fair sample, so many people will still persist in the delusion that it does not make very much difference what one feeds if he only feeds enough?

Do U Want Pure Water

For your House, Barn and Stock? Then investigate our Sanitary Water Tanks. Large Catalogue sent free.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited.
FRED TSCHUDY & SON, Monroe, Wis.

The Evolution of Dairying.

ED. HOARD'S DAIRYMAN:—It is not less true of agriculture, than it is of other arts, that the story of its progress is the record of simple products succeeded by complex ones, as well as of the division and specialization of labor in the making of products. The comparative newness of our country, together with the comparative perfection in agriculture and other arts to which it has so suddenly attained, affords opportunity even within the life of the individual man, to observe what the nature of agricultural development has been, for it is doubtless true that in many cases the same men that are now making application of the best intelligence in either dairying or stock raising have cleared the lands on which they work.

It is quite plain that the earliest, most primitive and most elementary phrase of agriculture is the raising of grain. The problem of the pioneer is bread. His earliest enterprise, in a wooded area at least, is the exchange of labor for land by cutting down the forests, which land of course is to be used for the growing of wheat and other grains. In prairie countries the order is the same, for the kind of land industry requiring the least expenditure of labor and capital on the part of the pioneer, is the stirring of the virgin soil. It likewise yields the readiest and largest return for the labor invested. This operation is comparatively simple.

But man shall not live by bread alone. This is good philosophy even in a purely material sense. Apart from its use in conserving soil fertility, stock raising following on grain raising is a natural and orderly phase of agricultural development, as it represents a progress from simple to complex in product making; for whereas in the grain growing phase, grain is an ultimate product, in stock raising it is only an intermediate and instrumental one, for instead of selling grain as grain, it is sold as meat. The production of beef to the best advantage then, evidently, requires greater knowledge and greater versatility than the production of grain alone.

The position of the cow, too, in the early stages of agriculture is interesting. It is not strictly true to say that the second stage of agriculture is a combination of grain growing with beef growing, for the cattle beast makes both beef and butter and draws the plow besides. Now the ox is superseded for power purposes almost entirely, and the business of producing beef and milk has been pretty well divided between what are commonly called the beef and dairy breeds. This is not to say that certain breeds produce beef exclusively and others milk. Though this is approximately true, we cannot get rid of the integrity and completeness of the cow kind; every cow carries flesh and is, to a greater or less degree, a milk making machine.

It is certainly true that the early cow has a general purpose character that is, to a great extent, lost through the operation of the principle of selection to single, special, definite, economic ends in later times. There has come about a distinct cleavage in cow society on the characteristic tendencies, depending on early circumstances and accentuated by culture and selection. In other words, the law of specialization, so universal in all industry takes another striking illustration from the cattle business.

There is one principle that is the spring of all such change. The character of all production is framed to give what mankind judges is the greatest reward for the minimum expenditure of labor. The progress of the world is the finding of the fittest means to satisfy the wants of the world. The happiest idea that sociologists have hit on in modern times in treating of the phenomena of society is the comparison of the whole world, or the whole of society to a single animal organism, which displays the same features in evolution as are displayed by the animal in its evolution.

The animal organism is simple at first, complex afterwards. It develops organs at the call of necessity or circumstances, such change being the evolution of the fittest instrument for the given end. So in society the division and specialization of labor are the production of the most efficient instruments to desired ends. *In short the economy of nature is economical.*

It must be understood, too, that all change that is the outcome of man's effort is as much nature or as truly natural as the changes that the lowliest of the animal kindom undergo farthest from man's influence or direction, for man is as much nature as is the beast. We feel disposed then to believe that the change which has taken place in the cattle beast, under man's direction, is economical. But this is another story and is not intended for a counterblast against the advocate for the dual-purpose cow. What a man keeps, whether beef stock, dairy stock or a compromise between the two is not to be decided absolutely, but relatively to conditions, markets and experience as to the suitability to his purposes.

The important thing to recognize is that dairying is a special business and as it narrows as a department of agriculture, it should deepen correspondingly, just as is the case with specialization in other industries. As the sharpness of objects is increased with the narrowing of the focus of the camera, so the insight into dairying should be increased with its growth to a special art. But this is not setting forth the actual view of dairying. In the great proportion of cases, it is not strictly a special art; or if it is special it is likewise very complex.

In practice, dairying is a combination of tillage, breeding and rearing and feeding, as well as the making and marketing of butter. The problem of the dairyman is the most feed of the best kind, in the cheapest way, and there can be no absolutely best kind. He must find the relatively best kind according to cost. Then his buttermaking must be economical, his product pure, and his taste good, in presenting his goods to his customers. Truly his business is of a special kind but of a very complex kind as well.

It may seem rather an imperfect conception of the dairy industry to almost tacitly make it synonymous with buttermaking. It is perhaps going rather fast. But having progressed through various agricultural stages to milk production, the question naturally rises: Where next? Milk itself is subject to either a general application or use, or to a special one; cheese representing the general use and butter the special one.

Viewed from the standpoint of the evolution of the milk industry, it must appear that butter is the higher product, because it represents a finer and more discriminating selection of milk constituents than is made in the case of cheese, for in the case of butter the casein elements are rejected. Does it not appear then that the butter side of the milk business is the one toward which effort is going to swing. It will be well for those who see in advance on which side their bread is buttered.

Besides the warrant which the universal law of specialization gives to this opinion, we have one still more practical and not less important. This is the law of increasing discrimination in the selection of food products by society. Increased fastidiousness and niceness is a constant law of living. Even though cheese includes as much as is included by butter and cheese together, as far as food elements are concerned, yet the tendency is undoubtedly to a discriminatory use of these commodities.

It is likewise true that the consumption of the former product, butter, is becoming more general. It is a staple and ordinary commodity on the table of the ordinary workman, where it was once a luxury. This heightening of the method of living is a very decided mark of industrial progress (using the word industrial in the sense of manufacturing) and of the overbalancing of rural population by town population, for though want is more commonly found in the industrialism of the city than it is in the country, mixed and elaborate living is a mark of the town and simple living a feature of the country.

The recognition of the constant operation of these two grand principles, viz., the natural tendency that all development has to specialization, and the growth of the dis-

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

ILLUSTRATION.

FROM FACTORY TO FARMER.

The great Hapgood Plow Co., of Alton, Ill., whose large plant is here shown, were the first and are to day the only plow makers who manufacture their own goods and sell direct to the farmer, saving him the profits he ordinarily has to pay to middlemen and agents. Their handsome catalogue, sent free on request, shows a thousand articles a farmer and his family want, in the way of machinery, buggies, wagons, harness, sewing machines, etc., all sold at lowest possible manufacturer's prices. The responsibility and integrity of the Hapgood Plow Co. is unquestioned, and cash can be sent them with all orders with full assurance that all goods will be just as represented or money promptly refunded on their return.

criminating habit in the choice of food, should be to the butterman a solid and substantial encouragment for future expansion and concentration of effort.

At the same time he must recognize that his business is a complex one, and requires great care, knowledge and versatility. It is well to remember too, that the largest margin of profit falls in the best grades of a general commodity and is more likely to fall to any grade when the demand is growing and rising and not when it is falling.

J. McCAIG.

Luhbridge, Alta. N.-W. T.

Cedar Hill Jersey Farm Notes.

Milk Fever—A Noon Feed—Sorghum for Soiling—Handling Manure—Seed Corn.

ED. HOARD'S DAIRYMAN:—I wish some of the many people who have milk fever would send us a recipe for producing it. My boys have never seen a case of it and as I am giving them instructions in every line of dairy and herd work, would like them to see a case of this popular disease, so they may know it from other diseases. Now, honestly, readers of the DAIRYMAN: Why so many cases of this disease? I have in past 15 years handled herds of from 40 to 100 head of milch cows and had but two cases. My father in a life time of 65 years lost but one.

* * * * *

These days we are feeding the herd a noon feed of sheaf oats and corn fodder cut very fine and steeped 12 hours in hot water. The results are very satisfactory, so much so that the coming year we shall save a large amount of sheaf oats and corn fodder for feeding. Instead of steeping in the hot water we will build a large chest of flooring and run a steam pipe into it and steam the fodder and oats. A dairyman friend in Ohio who follows this plan likes the feed better than ensilage.

* * * * *

We were in great luck in securing our ice crop as we did. The crop was a very fine one in quality and was 8 and 10 inches thick. We finished just in time. One day's delay would have caught us with a partially filled house. We worked New Years day or it would have been just that day's work that we would have lacked.

* * * * *

In my institute and dairy convention work in past few months, I have been struck with the growing popularity of sorghum, both as a soiling crop and also for hay and ensilage. I have for some years been convinced it was very valuable in the dairy herd. My last year in Texas was one that gave a good illustration of its merits as a forage and soiling crop. Our herds from July to October were fed on both green and cured sorghum, as their source of roughage, owing to the lack of any pasturage, caused by a severe drouth. They kept up the flow of milk well, and the supply was cut from a very limited amount of ground. We shall plant 15 acres this spring in drills, 18 or 20 inches apart, cultivate with a Hallock weeder and Planet Jr. horse hoe. When fit to feed will use our Deering corn binder to cut the daily feeds. With the binder one can save a great amount of time and work, besides being able to gauge amount fed by counting bundles. If we have a greater amount than we will feed as soiling crop, the balance will be cut and shocked to be run through the cutter and fed from the steam chest.

* * * * *

We have 78 head of Jersey cattle and 10 head of horses and not one load of manure piled around the buildings, is our record. Seven days in the week our manure is run into a spreader and goes direct to field. The boys have the work down fine. They run manure up an incline on wheel barrow into the spreader saving handling but once. We estimate that our corn crop will be doubled where manure is spread, and from amount of land covered with each load it will give us 5 bushels extra, or $1.50 for each load of manure made. This may appear a high estimate to many DAIRYMAN readers, but when you consider our spreader is a 3 horse size and the manure is from cows fed as high as good judgment will admit of with cotton seed meal, ensilage, clover hay, etc., it is a very reasonable estimate.

* * * * *

Seed corn will be an object this spring with the farmers of our county. Our best corn tested 10 kernels out of 58 good. The frost caught the crop just when it was maturing. Freeze, I should have said; it did not stop to frost. "BUFF JERSEY."

Monmouth, Ill.

Ohio Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The Ohio State Dairymen's Association offers, at the annual convention to be held in Townshend Hall, O. S. U., Columbus, Feb. 13th and 14th, 1900, a program replete with subjects of interest to dairymen, and cash and special premiums amounting to over $300.00, that should bring exhibits from every ambitious butter and cheese maker in the state. One great aim of the Association is to instruct in the points that the markets and consuming public demand. With this object in view the Association has secured competent butter and cheese graders to score every exhibit. Exhibitors will be given a score card showing the grade of their products.

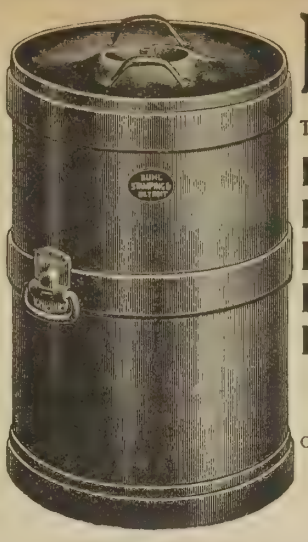
Judging and scoring real dairy cattle in the stock rooms of Townshend Hall by Director C. S. Plumb, of Purdue University and Indiana Experiment Station, will be an object lesson none should miss, who expect to ever buy a cow, or weed out poor ones from his herd. There will be a large exhibit of up-to-date dairy implements in actual use by the Dairy School, now in session in the basement of Townshend Hall. All together we think we offer a series of object lessons that are not surpassed anywhere. We hope the dairymen of Ohio will attend and by their presence and voice instruct and be instructed so that all may return to their homes, inspired to greater efforts in raising the standard of Ohio dairy products, dairy stock and dairy men and women.

For further particulars, program and premium list, address

L. P. BAILEY, Sec.-Treas.,
Tacoma, Ohio.

Cleaning House

Once or twice a year the good housewife has a thorough house cleaning. The house has been swept and dusted every day in the year, but the housewife knows that in spite of vigilance dust accumulates in cracks and corners, and is only to be removed by special effort.



It's the same way with the body. You look after it every day. You take all the ordinary precautions of cleanliness and health. Yet the body needs its special cleaning to rid it of the accumulations of waste and poisonous matter which invite disease. Doctor Pierce's Golden Medical Discovery, taken regularly once or twice a year, would save many a sickness. It purifies the blood, strengthens the stomach, and cleanses the body of poisonous accumulations.

"Last spring I had a severe attack of pneumonia, which left me with a bad cough, and also left my lungs in a very bad condition," writes John M. Russell, Esq., of Brent, Cherokee Nat., Ind. Ter. "I had no appetite and was so weak I could scarcely walk. My breast was all sore with running sores. I got two bottles Dr. Pierce's Golden Medical Discovery, which I believe saved my life. I cannot express my gratitude to you. I am able now to do very good work."

Dr. Pierce's Medical Adviser, in paper covers, sent *free* on receipt of 21 one-cent stamps to pay cost of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

HALLOCK'S Success Anti-Clog Weeder and Cultivator

Pays for itself the First Season, say farmers who have used it.

LAFAYETTE, IND., July 20, '99.
I simply wish to say that I am more than satisfied with the 12 foot mounted Weeder I purchased of you last spring. My corn is cleaner and my ground worked better than it ever was before.
I would not think of parting with it for $100 if I could not secure another like it. I expect to send you some orders next spring, as my neighbors like it also.
Yours truly, D. D. COLE.

JACKSONPORT, WIS., July 14, '99.
Please send me circulars of your Potato Digger. Your Weeder has made it possible for me to grow 1000 bushels of potatoes for about one-half the cost of cultivation, so now perhaps you can help me to dig them for one-half the cost.
Respectfully yours,
HARRY WILSON.

MORRIS, ILL., June 7, '99.
The Weeder I ordered of you came all right, and it gave perfect satisfaction on corn, strawberries, and all other crops I could use it on, and will surely please everyone who wishes thorough cultivation.
I would like the agency.
Respectfully yours,
B. W. WHITE.

ARE THEY GENUINE? Write them, send postal card for reply. It will give us pleasure to send you hundreds more.

We want to tell you all about it. May we?
Money saved by buying quick.

Partition in a Silo.

ED. HOARD'S DAIRYMAN:—Your paper is without questi n the most practical dairy publication because it presents the needs of improved dairy methods in a reasonable and practical way. Men who do a thing and report how and why, with results, place facts that are in advance of any theory.

Two years ago we built a silo, octagon, 17 feet in diameter, 32 feet above a 2 foot wall, made of second quality hemlock lumber, lathed and plastered with Portland cement. It was late in season when built and was filled before fairly cured out, therefore ensilage injured some next to the walls. In the fall of 1899 we whitewashed it thoroughly with cement, about as thick as cream, and put a partition through the center making it into two parts. This partition is made in sections two feet wide and long enough to reach to a post in the center of silo. We feed down one side four feet then cover ensilage with the spoiled cover from the other side and feed it down below the opposite side 4 feet, then cover with the same old covering and so on down. Result: Fine sweet ensilage and no waste. Will build another plastered silo this year

Erie Co., Pa. E. F. DAVENPORT.

A Colorado Ration.

B. D., Colorado Springs, Colorado, has alfalfa hay at $10; bran, $15; corn chop, $14.50; oil meal, $28; and can get oat straw at $7. His problem is to select from these feeds the most economical, and therefore, the most profitable ration to feed cows.

We still hold to the statement made some months ago that the ideal ration in this case would be 20 lbs. of alfalfa hay and 8 lbs. of corn chop, provided about one-half of the alfalfa hay could be chaffed and mixed with the corn. Readers of HOARD'S DAIRYMAN will recall that sometime after making a suggestion of this character to another Colorado correspondent, the Denver *Field and Farm* took us quite severely to task, claiming that the suggestion was not adapted for use in that part of the state. Since that time the Kansas Experiment Station has been pursuing precisely this line of feeding, with very satisfactory results, thus confirming the opinion we have long entertained in showing that the figures for such a ration were not misleading. In the event, however, that it is impracticable to chaff this hay, we would substitute 4 lbs. of bran for 4 lbs. of corn chop, in order to dilute the corn and thereby make it more easy to digest.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

INJURY TO JOINT.

I have a mare, 11 years old. Got injured in the whirlbone joint about the first of December; is lame, not so bad as at first. Was blistered over joint rather badly, did not intend to blister. Goes very heavy on toe and the fetlock seems to be inclined to bend forward. When walking, steps rather wide apart with hind feet. Would it injure her for breeding? J. M. C.

Transit Bridge, N. Y.

ANSWER.

Rest is all paramount. With a long rest, she may so far recover as to be useful. If feverish, keep wet with strong oak bark tea, two quarts, acetic acid, ¾ of a pint. Mix and use. Keep from freezing. Not having an hereditary disease, she is eligible for breeding.

GARGET.

My employers have a fine Holstien cow, due to calve the 26th of March About three weeks, before she is due, her bag will begin to cake, and when she freshens, it is as hard as a stone, so large that it has measured 63 inches around it. It does not feel like other cows' bags that are caked, but more of a jelly substance, so when you press your hand against it, it will leave a dent for a few minutes.

Last spring her belly swelled so you could not feel her veins, and her brisket was about three times its normal size.

We are milking her at the present, and

$18.50 for this **team harness**, cut from select oak-tanned leather, traces 6 ft long, 1½ in. wide, with cockeyes; 18-ft lines; Hook & Territ pads, pole strap 1½ in; collar strap 1½ in. **Big Bargain.** All kinds single & d'bl. harness.

18.65 and up. **BALL BEARING,** All Steel Disc Harrow, with or without center disc Discs 16 and 20 in. 8 sizes. **Our improved 12-16 disc, with 2, 3 or 4 h. evener, $18.25.**

$8.90 for steel lever harrow; cuts 10 ft; 60 teeth, 2 sections; also 3 & 4 sections.

$10 BUYS a 14 in. Double Shin, Soft Center Steel, Steel Beam Plow. **Guaranteed to scour.**

$6.40 BUYS 2 horse Chilled Plow. **1-horse Plow $2.25.** 65 sizes and kinds of Chilled Plows.

$20.55 BUYS this 8-ft. steel mill; guaranteed easiest running & strongest made; pumping and power mills, 8 to 16-ft.; also tanks, pumps, pipe & all pumping supplies. We furnish complet Outfits. **Prices all reduced.** *Catalog free.* Don't fail to send for it. Pay double—get no better

$11.90 This 2-horse **Cultivator,** made of best material, with shields, neck yoke and doubletrees, steel wheels. **Price, complete, $11.90.** Usually sells for $16.50 to $18. **Riding Cultivator** only **$17.50.**

$1.00 Bow Seeder **$1.** Crank Seeder, **$1.15.** Sows wheat, oats, grass seeds, etc. Sows 33 feet at a passage. Works perfect. Usually retailed for $3. **Prices reduced.**

75c For this hand corn planter **$8.65** for **No. 96B one-horse corn planter. No. 96½ one-horse planter** plants in hill or drills corn, beans, peas, garden and all other seeds. Price **$11.50.** Fertilizer extra. **Check Row 2-horse planter $24.75 to $32.50,** 95 styles.

Send for our FREE 352-Page Spring Agricultural Catalogue.

MARVIN SMITH CO., 55-57-59 N. Jefferson St., R-18 Chicago.

Springer Farm Separator,

MANUFACTURED AT

WATERLOO, IOWA.

THE SPRINGER HAND SEPARATOR skims the cream perfectly. It is the **Simplest Separator on the market.** It is easy to run and easy to clean. The machine which skims 300 pounds an hour costs $75.00, the 400 pound an hour $90.00. It can be attached to any kind of power. If you contemplate buying a machine, write us.

GRINDSTONE COMPLETE WITH FRAME $1.90 EACH.

Upon receipt of $1.90 we will forward, properly packed, **one celebrated BUENA VISTA GRINDSTONE and FRAME Complete,** which we warrant to be **Absolutely Unexcelled** as to quality, finish and durability. This celebrated stone is the highest quality on the market and will be found excellent for any grade of work. **We use nothing but first grade stones. They weigh from 40 to 50 pounds.** In order to save on the freight charge, we will ship knocked down. It is simply constructed and can be readily put together.

We carry all kinds of grind stones. Write for free catalogue No. **20** on merchandise bought at **Sheriffs' and Receivers' Sales. *OUR PRICES ARE ONE-HALF OF OTHERS.***

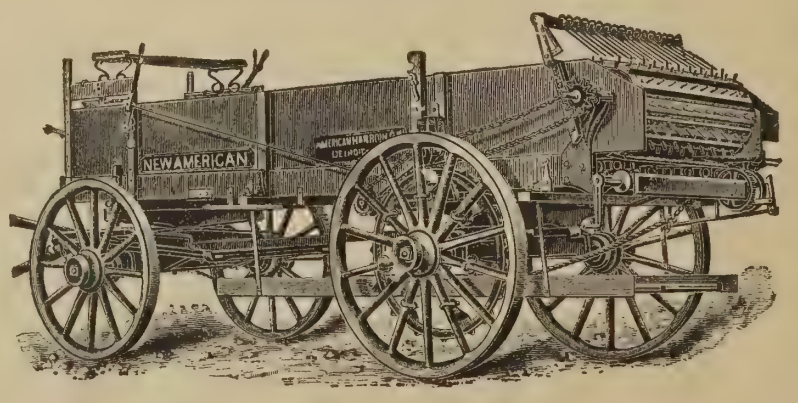
Purity and Dryness

ARE QUALITIES THAT DISTINGUISH

Diamond Crystal Salt.

The relative purity of the dairy salts of the world is given in a valuable bulletin lately issued by the UNIVERSITY OF WISCONSIN.

Speaking of DIAMOND CRYSTAL, Prof. F. W. WOLL says:—



"The claims of this company for exceptional purity and dryness in their salt are fully substantiated by the analytical results obtained by the writer."

Lime and chloride impurities injure butter; damp, heavy salt is unfit for dairy use. **"The Salt that's All Salt"** is both PURE and DRY. Every dairyman should insist on having it.

DIAMOND CRYSTAL SALT CO., St. Clair, Mich.

ILLUSTRATION.

THE NEW AMERICAN MANURE SPREADER.

There are farmers who pitch manure from the wagon on to the soil; then scatter it about and say Amen. That beats nothing, but there's a better way that's cheaper and more profitable in the end.

Now if you scatter manure by hand, its going to be too thick in some spots. That has a tendency to "fire" the seed and to retard the plant. Other spots will be devoid of manure and consequently of proper nourishment. The American Harrow Company, of Detroit, Michigan, is manufacturing the New American Manure Spreader. It will fit any ordinary wagon gear; or when desired it is furnished with gear complete. One lever throws the machine into gear, and it works automatically from that time till the load is discharged and the machine is in position to start again with a new load. No other attention need be given it. The box is wider behind thus preventing friction. The feed is positive, scattering the manure in any desired quantity.

All kinds of manure are pulverized fine or coarse. It will feed slowly or rapidly. It can be regulated to the greatest nicety, and all is accomplished with a single lever while the team is moving. One man can operate it: one team handle it easily. Its capacity is from 50 to 60 bushels. It saves the manure. It spreads it exactly right to do the most good, and the makers say it won't leave the buyers' pocket in mourning.

"The logic of it now. The proof of it by the harvest" is the title of booklet "E" which is being distributed by the American Harrow Company, Detroit, Michigan.

would you continue to milk her until she freshens, or would you dry her off? Her bag is in nice shape now. K. B. P.
Parkman, Ohio.

ANSWER.

All the medicine in the world will not serve your case as well as repeated full physicking. Reduce the feed also. Don't be afraid of hurting the cow by stinting the food. Rub the udder a few times, 3 to 4, with strong camphorated spirits, six parts and common turpentine, two, only, parts. Use much massage; gently and thoroughly reduce the system as advised. This will be of use before and at parturition and is always a safe course to pursue. Rub only once a day with the camphorated spirits.

FLATUS PIPE FOR BLOAT.

I notice in your issue of January 5th, page 945, your veterinarian recommends the flatus pipe for cases of bloat. We have much trouble from cows bloating when pasturing on alfalfa and often resort to puncturing to relieve them. If there is a better way I want to know all about it. What is a flatus pipe and how is it used and all about it? Our cows sometimes bloat so badly that if they are not relieved within twenty minutes they die. Feeding hay before turning on the alfalfa only makes the matter worse.
Tygh Valley, Or. A. A. B.

ANSWER.

Lucerne is not a safe pasture. It should be suited to the stock, always, unless poor and scrubby. Cows may be allowed to obtain a good feed, but not to repletion, never. Flatus pipe means a hollow tube to push down the throat into the rumen or paunch and so allow the accumulated gas to instantly escape. Mine cost two guineas in London; it is flatus pipe and probang in one. Six and a half feet best rubber garden hose answers all the purposes and is always effective. It needs to be rinsed whilst being used by running warm water through it and smooth and oiled on outside.

UNKNOWN CAUSE FOR DEATH.

I have lost three head of cattle, coming one year old, in the past few weeks; they are all well at night and dead in the morning. One of them had blood settled under the hide about the hip, the other had blood settled on the shoulder; the last one to die had blood settled along on one side of the neck. I have been giving them saltpeter and sulphur for about one week. They are not fat but in good order; feed them oats and hay.
Muscoda, Wis. J. N.

ANSWER.

I have never heard of any case that in any sense is analagous to yours. I have just returned from a consultation with one of the best doctors in the state. He, like myself, never heard of anything at all similar. He and I said, poison by inoculation, some how. Your case ought to be investigated by some first-class expert. I believe you have some sinister, vicious act to which you may look for cause.

TUMOR ON UDDER—EXCESSIVE SWEATING.

I have a cow that has a lump in udder just in front of hind teat; at times it is the size of a hen's egg and hard; at other times you can hardly feel it. It does not seem to be sore, as you can squeeze it and she does not mind it, but it is in the way when milking; can hardly get hold of teat.

Also have a yearling colt that sweats so that it is all wet when standing in stable; it eats well, is lively when out in yard; it has a heavy coat of hair, also has a disagreeable smell; feed oats and straw. SUBSCRIBER.
Markham, Ont.

ANSWER.

Paint over the tumor with strong tincture of iodine, three to five times a day, for some days. Don't touch any but the tumor spot. Internally give 60 to 70 grains of iodide of potassa in a little cold water as a small drench every morning. Don't ever *squeeze* the tumor.

May be dropsy under the skin. You had better get a competent man to make a personal examination; such alone can determine the true condition.

SCOURS.

Calf 5 weeks old, doing well on five pints skim milk twice a day, and a little dry bran and all the hay it would eat. Put pint of bran in milk four times, when scours set in, and now for four days she refuses to eat anything, except half gallon milk a day. She grinds teeth together and froths at the mouth. Sometimes seems to want to eat but does not seem able to do so. Will not take milk unless put finger in her mouth. Will chew bread if put in mouth. Sixty hours apart gave 2 doses of castor oil, laudanum and nux vomica, have also given flax seed tea, and caraway seed tea, as I saw in the invaluable DAIRYMAN.
Atlanta, Ga. L. G.

ANSWER.

Give the mucilagenous gruel recommended last week, either or all of them. The irritation caused by the bran—in milk—caused the diarrhœa no doubt. Oil of any kind has no place in the stomach of the bovine family. Oil may be given as an injection. Stop the skim milk for awhile. The mucilages are not likely to stop the diarrhœa at once—such a thing is not desirable by any means, at any time. But if you persevere there will be no difficulty of ultimate success. See last week's edition.

EPILEPSY.

What is the trouble with my calves dying so suddenly? They appear to be healthy and eat well, then suddenly they become weak and commence to stagger and fall down and die in about half an hour or so. I bleed them in the ears but it does no good. Their feed consists of straw, oats and oil meal, a little two or three times a week, and no milk. These calves are from four to six months old. T. R.
Jasper Co. Ind.

ANSWER.

There is no question as to the cause of the death of your calves; epilepsy, termed fits, megrims, staggers, etc. This is a nervous disease resulting from an impoverished condition of the blood, consequent upon a poor condition generally of the afflicted animals. There is little to be expected from doctoring. Prevention by good nutritious food, clean, airy housing, sunlight and pure air; these are the essentials to good robust health and always pay good returns.

VACCINATION FOR ANTHRAX.

Is vaccination considered a sure preventive for black leg or anthrax in cattle?
Hanford, King Co., Cal. R. A. D.

ANSWER.

Your question depends on the condition, or form of anthrax. Some very few posted men say that vaccination does cure. I have never known of a cure of malignant anthrax, by any means of any kind, with me. Like all malignant dangerous diseases, anthrax is the death warrant, as the best and safest remedy. Of course, before destroying an animal suspected, it is well to have an expert examination, and that, too, by an honest, genuine expert.

ITCH—LUMP ON LEG—DROPSY.

Some new disease has broken out on the horses of my section. They break out on body in lumps, large as peas; horse gnaws and scratches himself, till hair comes off; skin gets thick and hard and will break.

No. 2. Have a mule; several years ago a lump came just above knee, inside of fore leg, situated on big artery; it is now as large as your two fists; mule got so she could not work; I lanced it several times, full of blood; made strong solution of caustic potash, and applied, but don't cure. What is your remedy?

No. 3. Had a fine Jersey cow giving milk; milked her one evening, but she never eat, but never showed sick; next morning was down, could not get up, by ten o'clock she was dead; on right side, between hide and meat, just above last rib, you could tap on her and hear a sound like water; on examination proved to be a collection of yellow water; her gall bladder was about five inches in length and three in breadth; had been milking 7 or 8 months; had been pasturing on swampy land. W. A. B.
Henry Co., Ga.

ANSWER.

You have a clear cases of itch or scabies. It seems it has become endemic in your neighborhood, and will be likely to stick and spread. You are in a bad predicament, and need a good professional man to look to your condition, and try and stamp out the disease. If there is swelling, you may have farcy, then glanders, etc., so you see the necessity of personal professional attention. You ought to notify the state veterinarian, if you have one.

No. 2. I have not any remedy; you have completely spoiled my chances by opening, etc.

No. 3. You had dropsy, consequent, I think, upon a diseased liver.

TUMOR ON UDDER.

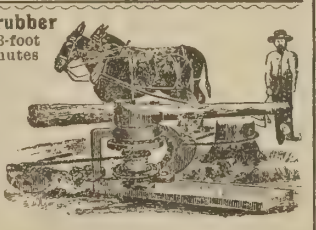
I have a fine Jersey heifer, one year old, which has a large swelled place just in front of udder, of about a month's standing. I opened with knife and it run quite a lot of yellowish water, after which she seemed much improved; but there is yet a hard place, about the size of a goose egg, and it is a little sore. G. D. E.
Waco, Texas.

ANSWER.

You, like the querist above, have come to me when my best chances are spoiled, by your doing surgery. You have seated the tumor—now a tumor—in a position to remain; opening is a dangerous course to persue by the layman. Always cut off the hair close, and paint the lump, only, with strong tincture of iodine, and internally give 60 grains of iodide of potassa in a little cold water as a small drench, each morning, for 50 to 70 days, if needed; after two weeks, reduce the potassa to the 50 grains.

ILLUSTRATION.

PROFITS on vegetables depend more on the cost of labor in cultivating them than on any other one factor. You save time and you save the wages of hired help when you use such garden helpers as the Iron Age implements, for plowing, sowing, hoeing, cultivating, raking, covering, hilling, etc. In buying a combination implement you get a valuable outfit of garden tools for the price of one and the experience of thousands of vegetable growers proves that all the Iron Age tools are practical labor savers. Before sitting down to figure on saving cost of labor in growing vegetables either for market or for the home table, it is best to write for a copy of the Iron Age Book for 1900. It is a handsome catalogue sent free by the Bateman Manufacturing Co., Box 153, Grenlock, N. J. It describes all the implements having the famous "Iron Age" trademark, which have the reputation of being the most reliable in use, and it gives the description and prices of each. It describes the many uses of the Iron Age tools, and contains hundreds of suggestions and hints that will help to place vegetable growing on a more profitable basis.



Horse Owners! Use

SOMBAULT'S
Caustic Balsam
A Safe Speedy and Positive Cure
The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*
Every bottle sold is warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars.

The greatest labor saver ever invented. Send for illustrated catalogue to D. B. CHERRY & CO., Knoxville, Marion Co., Iowa.

TWO FINE SPECIMENS
Of Physical Manhood.

No form of athletic exercise demands such perfect physical condition as prize fighting. Every muscle in the body must be fully developed and supple, and the heart, lungs and stomach must act to perfection.

Whether we endorse prize fighting or not, it is nevertheless interesting to know the manner by which men arrive at such physical perfection.

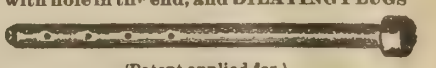
James Jefferies, the present champion heavy weight of the world, and his gallant opponent, Tom Sharkey, in the greatest pugilistic encounter that has ever taken place, both pursued much the same course of training, and the first and most important part of this training was to get the stomach in condition, and keep the digestion absolutely perfect, so that every muscle and nerve would be at its highest capabilities

This was not done by a secret patent medicine, but both of these great pugilists used a well known natural digestive tablet, sold by druggists under name of Stuart's Dyspepsia Tablets, and composed of the digestive ferments which every stomach requires for healthy digestion.

Champion Jefferies says: "Stuart's Dyspepsia Tablets prevent acidity, strengthen the stomach, and insure perfect digestion. They keep a man in fine physical condition." Signed, James J. Jefferies, champion of the world.

The gallant fighter, Sharkey, says: "Stuart's Dyspepsia Tablets remove all discomfort after eating. They rest the stomach and restore it to a healthful condition. I heartily recommend them." Signed, Thos. J. Sharkey.

The advantage of the daily use of Stuart's Dyspepsia Tablets is that they keep people well and ward off sickness, and are equally as valuable to well persons as to the dyspeptics. Another advantage is that these tablets contain no cathartics, or poisons of any character, but simply digestive ferments, which are found in every healthy stomach, and when digestion is imperfect, it is because the stomach lacks some of these elements, and Stuart's Dyspepsia Tablets supply them.



They are no cheap cathartic, but a perfectly safe and efficient digestive, and the demand for them is greater than the sale of all other so-called dyspepsia cures combined. No remedy could possibly reach such a place in public esteem except as the result of positive merit.

Full-sized packages are sold by all druggists at 50 cents, and the best habit you can possibly form is to take a Stuart's Tablet after each meal. They make weak stomachs strong and keep strong stomachs vigorous.

Barren Cows
CURED
With womb dilators. PRICE 50 CENTS. Address,
Dr. D. ROBERTS, Waukesha, Wis.

Milk Fever CURED by the Schmidt Treatment. 90% of cures in first 412 cases. Simple and effective. Two complete treatments packed ready for instant use. For sale only by GARDINER BROS., 220 E. Preston Street, Baltimore, Md.

Dr. Horne's Anti-Abortient
Prevents Abortion and cures Nymphomania—failure to breed; also Emmenagogue Powders for cows failing to come in heat. Both powders are the result of long practical experience and study and may be given in a little moist feed. 5 oz. $1, 11 oz. $2, 23 oz. $4, 50 oz. $8, by mail.
Also Specific for
SOUTHERN CLIMATIC FEVER
Same price and same quantity as above.
SAFETY HARD RUBBER MILK TUBES with hole in the end, and DILATING PLUGS

(Patent applied for.)
My Hard Rubber Tubes and Hard Rubber Dilating Plugs supplant all kinds of metal tubes. No blood poisoning or bruising. No dropping out of teat by its own weight. Two hard rubber tubes—2 and 3 inches long, and two plugs $1.50 the four—and also one bistuary and two plugs $1.50 the three. By mail, the whole set $3.00. In writing for medicine, please say if the cow does or does not come in heat—as the medicines are as different as fire and water.

Dairy Farming in the Maritime Provinces.

The Work of the Maritime Experimental Farm to Advance Dairying—Handsome Returns From Dairy Farming.

ED. HOARD'S DAIRYMAN—Under the careful management of Supt. Robertson, the experimental farm for the Maritime Provinces at Nappan, N. S., has been doing some exceptionally good work for the farmer and particularly so in the dairy line. Mr. Robertson, as is well known, was a successful breeder of Ayrshires in Quebec previous to his taking charge of the experimental farm.

Last year the grain crops at Nappan, owing to the extent to which rust prevailed in the eastern provinces, were lighter than usual; but Indian corn and root crops did unusually well. The average of all the varieties of Indian corn at Nappan was 16 tons per acre. The average of the best six sorts was 20 tons, a fact which goes to show the signal advantage of our farmers paying more attention to varieties, for the largest crop was 23 tons 1,850 lbs. per acre. Roots generally succeed well in the Maritime provinces, the average of all the varieties grown was 26 tons. The average of the best six sorts, 30 tons and the largest crop of any one variety, 31 tons per acre.

In mangels the average of all the varieties was 23 tons 841 pounds; the average of the best six sorts, 30 tons and the largest crop, 38 tons. Carrots gave an average yield of 15 tons for the best six varieties; all which go to show that the Maritime province is naturally adapted to giving foods for dairy cows and the absolute importance of paying attention to varieties

Horse beans have been tested during the past season and have succeeded well at Nappan, the largest crop being 13 tons

The best results were obtained by growing them in rows two feet apart. Then the Maritime dairymen have an advantage over those in all the other parts of Canada, for while this great protein crop has done remarkably well at the Maritime farm they have done poorly at all the other farms. Soja beans have been tried last year at all the experimental farms. They have not done as well at Nappan as the horse bean, but at all the other farms in Canada they have done better.

Another promising fodder plant that has found a great success at the Maritime Station is the new Japanese millet. It gave a yield, last year, of 17 tons per acre, grown 15 inches between the rows. It is not surprising, therefore, from the above showing that Supt. Robertson has considered it in the interest of the Maritime farmers to make dairying the leading specialty at the farm, seeing the adaptibility of the province to the production of butter at an abnormally low cost.

During the past year Supt. Robertson has conducted a comprehensive test with the whole herd of milk cows, 27 in all, showing the cost of feed and receipts from sales of milk, setting the manure against the labor. The results show an average profit of $14 per cow. The different animals vary much; the the best gave a profit of $28.64; the poorest one, 21 cents, showing that it is very important for farmers to know what sort of animals they are feeding and to watch the results they get so that they may find out whether each cow is giving them a profit or whether they are keeping some animals for the pleasure of their company.

A comparison was made by Mr. Robertson of two groups of cows, about equal in quality, which showed that more profit was made from cows which calved in the fall than from those which calved in the spring. The fall calved cows gave more milk and consumed more of the rough products of the farm, the milk being sold at the creamery on the same basis as that of the surrounding farmers. The superintendent says: "One striking fact is that the cows of equal quality (as near as can be judged) which were fresh in the fall gave more profit than their equals fresh in the spring, besides consuming more of the rough products of the farm. For instance, cow Nos. 21, 24 and 26 were fresh in the spring and consumed $117.62 worth of feed, paid for it and left a balance of $63.13 to their credit. While Nos. 6, 17, 22 and 25 that were fresh in the fall, consumed $154.51, paid for it and left a balance $106.11, being $10.75 per cow in favor of the fall calved cow."

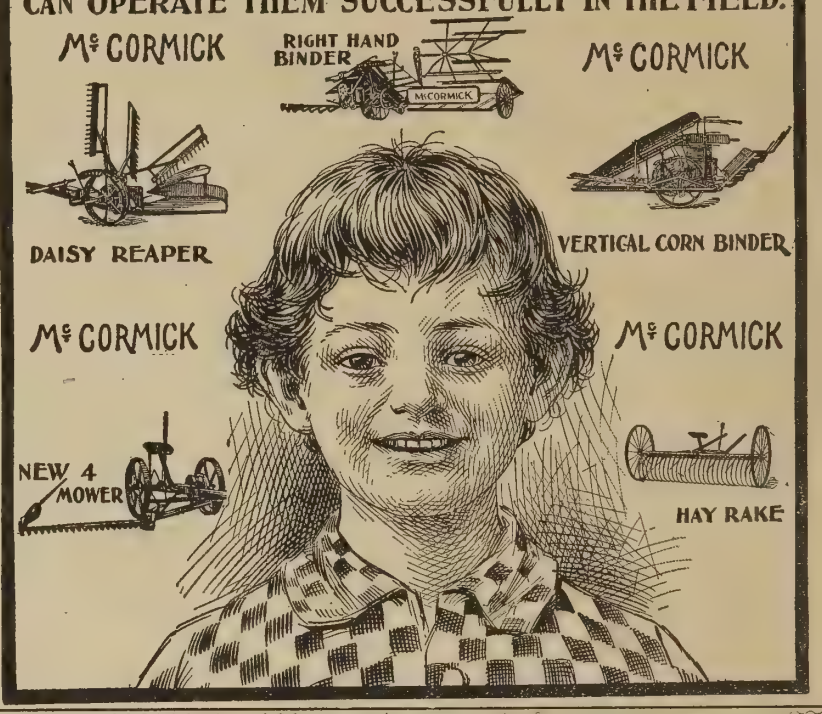
This is certainly an object lesson to our dairymen. Only a small majority of the cows in these provinces calve in the fall. In a county or the provinces where fodder crops of the best quality grow with such luxuriance is it a wonder that dairy farming is so rapidly on the increase, and that the profits of those already well along in dairying have been so good. The high price of concentrates is the greatest obstacle to winter dairying in these provinces. When wheat bran costs $20 to $25 per ton, and middlings even higher, and when all grains can seldom be obtained for much less than one cent per pound, ground, such a protein crop as horse beans, comes in almost providentially. When horse beans do so well and when peas are always a sure crop, the problem of obtaining protein food is almost completely solved. The new Japanese millet is a crop that holds forth great inducements for our dairymen, particularly so in localities where Indian corn does not do well. J. A. M.

From an Oregon Dairyman.

340.5 Lbs. of Butter per Cow.

ED. HOARD'S DAIRYMAN:—In sending renewal, would like to say we cannot get along without the DAIRYMAN. We would be pleased to send new subscribers, but can get none, as they know all about dairying without taking a paper (?).

We have a herd of 20 cows, some full blood and grade Jerseys. Have just finished the year's record of 12 cows, and find that they averaged 340½ lbs. of butter per cow, (adding 1/6 to butter fat.) Among the lot are 3 heifers with first calf. The highest yield was 463 lbs. of butter, and the lowest 228. The milk from each cow is weighed every milking, and recorded every Saturday, and tested each cow's milk 4 times, during past year. Feed mill-feed every day in the year. Have two silos, one larger than the other, each 25 feet deep. Silage, tares with some wheat mixed in; fill silos several times and let pack, then fill the last 8 or 10 feet with red clover; it is all filled in whole. The silage is fine, but little spoiling around the edge. Intend feeding silage the year round. We owe all our success to HOARD'S DAIRYMAN, which we have taken four years.



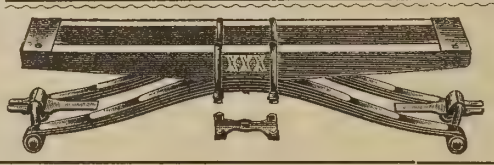
In passing judgment on Countess of Level Green, and My Lady Baltimore, we would say that the latter is the better cow, having the deeper hind quarter and barrel, also a larger udder and milk vein, but hasn't as nice a head as the Countess. Wishing the DAIRYMAN all success, we remain.

OAKERMAN & SON.

Washington Co., Or.

McCORMICK MACHINES are built in the largest works in the world manufacturing harvesting machines and binder twine. McCORMICK holds the worlds record 213,629 machines built and sold last season. This enormous output has been created by building the BEST IN THE WORLD.

McCORMICK MACHINES ARE SO EASY TO HANDLE THAT YOUR BOY CAN OPERATE THEM SUCCESSFULLY IN THE FIELD.



Choose a Carriage

With the help of our catalogue. It offers a wider choice of vehicles, harness, robes, blankets and horse accessories than dealers carry in stock, at prices lower than any dealer can quote. We are carriage and harness makers on a big scale, with every facility for turning out the best work at the least cost.

You Save the Difference between the maker's and the dealer's price when you buy from us. Money returned and freight paid both ways if you are not satisfied with your purchase. Write for the catalogue—it's free.

PLANT AND CULTIVATE with a "Planet Jr." No. 25 Combination Hill and Drill Seeder and Double Wheel Hoe.

This is the latest addition to the famous "PLANET JR." line, and like all its predecessors it is the best thing of the kind for the purpose. It is intended for those gardeners who have a large enough acreage in crops for a Double Wheel Hoe to be used to great advantage, and yet prefer not to buy a Wheel Hoe. It is large enough for field use as it holds 2½ quarts (or about 5 lbs. onion seed) and has 11¼ in. wheels—just the right size. As a drill it is almost identical with the "PLANET JR." No. 4 Drill. Sows in drills or hills 4, 6, 8, 12 or 24 inches apart. Has automatic device for throwing out of gear, new combined cut-off, seed index with thumb-screw attachment, &c. Thoroughly substantial and marvelously accurate in sowing all kinds of garden seeds in either hills or drills. As a Wheel Hoe it is identical with the "PLANET JR." No. 12 Double Wheel Hoe which is the very best machine on the market. Can be changed from Drill to Wheel Hoe in a moment. We heartily recommend this combination and guarantee it to be satisfactory.

We have just issued 850,000 copies of our new 1900 "PLANET JR." catalogue which in addition to being a work of art is a most valuable guide and reference book for farmers, gardeners, planters, orchardist, etc. Tells all about our full line of Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Harrows, Two-Horse Cultivators, Sugar Beet Seeders, Four Row Sugar Beet Cultivators, &c. Illustrations show how they are used in this and in foreign countries. We mail a copy of the catalogue free on request. Better write for it at once. Has 16 full pages of beautiful pictures.

WE KEEP THE FOLLOWING LIST OF **BOOKS** AS PREMIUMS For New Subscribers

And much prefer to send them out as such; however to those readers who are unable to secure subscribers, they will be sent post-paid upon receipt of price.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "THIRTY YEARS AMONG COWS," by N. B. White. Paper bound, 120 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "DAIRYING FOR PROFIT," by Mrs. E. M. Jones; paper bound, 65 pages. Price postage paid 50c.

FOR **TWO** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "A BOOK ON SILAGE," by Woll; cloth bound, 200 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "A B C IN CHEESE MAKING," by J. H. Monrad; paper bound, 68 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "A. B. C. IN BUTTER MAKING," by J. H. Monrad. Paper bound, 68 pages. Price postage paid 50c.

FOR **TWO** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "MILK TESTING," by Schoenman; 50 pages, cloth binding. Price postage paid 75c.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "CHEESEMAKING IN SWITZERLAND," by J. H. Monrad, (Emmenthaler, Etc., Brick and Limburger); paper bound. Price postage paid 50 cents.

FOR **ONE** NEW SUBSCRIBER . . . .
We will mail you, postpaid, "PASTEURIZATION AND MILK PRESERVATION," by Monrad; paper bound, 80 pages. Price postage paid 50c.

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "TESTING MILK AND ITS PRODUCTS," by Profs. Woll and Farrington; cloth bound, 250 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "MILK AND ITS PRODUCTS," by Prof. H. H. Wing; cloth bound, 280 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "THE SOIL," by Prof. King; cloth bound, 300 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "AMERICAN DAIRYING," by Gurler; bound in cloth, 266 pages. Price postage paid $1.00

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "CHEDDAR CHEESE MAKING," by Decker; cloth bound, 125 pages. Price postage paid $1.00

FOR **THREE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "OUTLINES OF DAIRY BACTERIOLOGY," by Prof. H. L. Russell; cloth bound. Price postage paid $1.00.

FOR **FOUR** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "FEEDS AND FEEDING," by Prof. W. A. Henry; cloth bound, 650 pages. Price postage paid $2.00.

FOR **FOUR** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "DISEASES OF HORSES AND CATTLE," by Prof. D. McIntosh; bound in cloth. Price postage paid $1.75.

FOR **FIVE** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "THE AMERICAN CATTLE DOCTOR," by Dr. Geo, H. Dadd. Bound in cloth, 365 pages. Price postage paid $2.50.

FOR **FOUR** NEW SUBSCRIBERS . . . .
We will mail you, postpaid, "BARN BUILDING," by J. H. Sanders Publishing Co.; bound in cloth, 285 pages. Price postage paid $1.50.

FOR **FOUR** NEW SUBSCRIBERS . . . .
We will mail you, post paid "WOLL'S MODERN DAIRY PRACTICE," bound in cloth, 285 pages. Price postage paid $2.00
